Category:SymbolsThe characterization and differentiation of cells of multicellular organisms is central to many biological processes, for example the immune response, tissue growth control, and hematopoiesis. Characterization of the various cell types involved in these processes requires the ability to readily distinguish and isolate individual cell types. The hematopoietic system is characterized by the presence of a series of discrete cell types from a common stem cell. The cell types are highly proliferative and the majority of these cells are capable of differentiation into a variety of cell lineages. The hematopoietic stem cell is the progenitor of all of the definitive hematopoietic cell types. See, for example, Metcalf, Nature 339:519-522 (1989). Stem cells are distinguished from differentiated cells by their capacity for

indefinite self-renewal and for the production of a large number of differentiated progeny.

Most stem cells also are quiescent and relatively undifferentiated; they are in a state of a cell cycle arrest. In contrast, differentiated cells enter a state of cell cycle arrest at certain stages of their differentiation program and begin to exhibit the characteristics of post-mitotic cells. See Metcalf, *supra*, at 522.

Because hematopoietic stem cells have the potential to produce more than a billion mature blood cells per day, it is essential to maintain the population of hematopoietic stem cells in the bone marrow in order to maintain adequate blood cell levels. See, for example, Miller et al., *Transplantation* 59:997-1000 (1995). The existence of hematopoietic stem cells was demonstrated in the mid-1970's by Dexter and Folkman who showed that the bone marrow contains a small population of pluripotent stem cells (“hemangioblast”) that could reconstitute the entire hematopoietic system in lethally irradiated mice. See Dexter and Folkman, *Nature* 221:428-31 (1969). Subsequently, a number of laboratories confirmed the existence of a pluripotent stem cell in bone marrow and identified the cell as a c-kit positive, Lin

Beograd: Kosmos izdavaštvo i Podgorica: Nova knjiga, 2017, pp. 30. General biographical note on Karl Gustav Jung www.iapp.org.br/index.php?author=29708 Q: How do I setup SSL on Ubuntu Server 14.04 LTS I installed a SSL certificate on Ubuntu 14.04 LTS Server via Lets Encrypt. I'm now wanting to go to production. I followed this link to see the Apache configuration that I need to make. This is the part of the website that I think is relevant. # Generic SSL virtual hosts # ServerAdmin webmaster@dummy-host.example.com # DocumentRoot "/etc/apache2/dummy-host.example.com/public" # ErrorLog "/etc/apache2/dummy-host.example.com/logs/error.log" # CustomLog "/etc/apache2/dummy-host.example.com/logs/access.log" common # SSLRandomSeed startup builtin SSLRandomSeed connect builtin SSLCryptoDevice builtin # SSLStaplingOn redirect AllowOverride None Options None Require all granted What I don't understand is where I put the certificate in the Apache configuration. I currently have it in /etc/letsencrypt/live/myDomain.com/certs This is an example of the certificate. -----BEGIN CERTIFICATE-----
