[2008-11-17 . B

(the two links above are both the same BHO) The error is no doubt coming from a sound application such as winamp or miro. The application is pausing the sound card, which is why the recording stops and the error is shown. A: You have a bad driver. A: I found after several days of testing that it is either the VGA Driver or the Realtek HD Audio Driver that is causing the sound card to turn off and the error. I did not pay any attention to the message from BiosCrypt that was on it for months in the history of posting that thread. The solution is to remove one of the drivers. I decided to remove the VGA Driver since it does not do anything anymore. I then ran BiosCrypt Verisoft Access Manager and restarted Windows. It was working without error. I was trying to install the Realtek Driver hoping it would fix the problem but every time I restarted Windows the error showed up and the sound card stopped working. It is working now and that error does not show up. These are the drivers:

VGA_06.00_Vista_Service_Pack_1_x64.exe, Realtek HD Audio Driver, The VGA driver can be found at: The structure of the lymphocytes in a gammadelta T-cell population in the shell gland of the green anole (*Anolis carolinensis*). Like its pleomorphic sister species, the American alligator, the green anole (*Anolis carolinensis*) is a gammadelta-bearing C-type invariant lymphocyte. The green anole has a unique lymphocyte population that is localised in a discrete region ba244e880a
