I've had good experience with .NET using SQL Server. I'm having an issue where I want to insert some data into a MySQL database table. I'm using mysqldb. I need to insert the same information into the same table, regardless of the row that is being used. I tried to use the MySQL INSERT without using phpMyAdmin and it works for some cases. I can insert multiple rows. I am always able to insert one row by using the following code `cursor.execute("INSERT INTO locations(lat, lng) VALUES(%s,%s)", [lat,lng])` However, when I try to insert into a MySQL table, it only works for one row. I'm not sure if this is the correct way to do it. I can't find any documentation or tutorials on how to do it this way. `cursor.execute("INSERT INTO locations(lat, lng) VALUES(%s,%s)", [lat,lng])` Note: This is a small example. I have approximately 25 million rows. A: This is because you are only executing the query, but not doing anything with the result. Change your code to this: `res = cursor.execute("INSERT INTO locations(lat, lng) VALUES(%s,%s)", [lat,lng])` and you should see the rows you inserted. In cases of active disease, the primary criteria for treatment choice are the severity of symptoms and the course of disease. Considering that the majority of patients with 2d92ce491b
