
Ransomware is a computer worm that enters a computer system, locks it and demands a ransom to regain control over the machine. How does Ransomware work? Ransomware is a type of malware that infects files on your computer, changes them so that they can no longer be read or used, and hides the files to make it look like everything is fine. Once the files are encrypted, you don't even know there is a problem. This is called a drive-by infection, because the malware is sent to your computer by visiting websites and opening files. If you get infected, you will not see any problems. Instead, you'll see fake security and system messages, and may even see pop-up ads that tell you to buy a product or call a number to get help. Ransomware operators want you to buy the fake product or call the phone number. You have no idea that you've been infected, until you see the message in the System Event Log, saying that you've been locked out of your computer. What to do if your PC is infected with Ransomware: Do NOT pay the ransom. If you do, it's a waste of your money, and the operators of Ransomware will make sure that you lose the data. If you want to get your data back, you need to use the decryption software supplied with the Ransomware. 1) Why are your files encrypted? Some Ransomware operates on a drive-by basis, when you open a file. That means that the virus automatically replaces some of the contents of the file with malware-looking information. 2) What is encrypted? The files are encrypted in the "crypt" folder. 3) What can you do if your computer is infected with Ransomware? If your computer has been infected, you can go to your device Manager and search for Ransomware.exe, then delete the malware using the tool supplied with your antivirus software. It will ask for administrator rights. [read more] Spyware is a software application that surreptitiously collects personal data without your consent or knowledge. The main objective of the tool is to entice the user to use it, after which it will get installed on the user's system and take over various functions without their knowledge. Eliminates hacking tools Virus Shield performs the role of a shield, keeping malicious programs, viruses, and other suspicious applications from 70238732e0
