Best Dissertation Writing Service UK Covers all Types of Dissertations, Thesis and. This invention relates to an improved filter medium and more particularly to a filter medium having a three dimensional network structure formed of glass microspheres bonded together by a binder. The filter medium of the invention is particularly useful as a replacement for the corrugated fiberglass filter medium of the prior art. Filter media, in the form of fiberglass or other sheet materials such as filter paper, exhibit substantially improved performance for removing suspended particulates from liquids when compared to conventional wetted filter media such as asbestos cloth. Prior efforts to increase the effectiveness of filter media to remove suspended particulates have in general provided a more open structure for liquid retention such as the use of corrugated fiberglass filter media and surface passageways.

(a) Field of the Invention The present invention relates to a driving apparatus for an electric power window. More particularly, the present invention relates to a driving apparatus for a window of an automobile including a wire operating motor. (b) Description of the Prior Art A general structure of the conventional power window apparatus for an automobile is shown in FIG. 1. Referring to FIG. 1, the conventional power window apparatus has a case 2 and a driving mechanism 4 which is disposed in the case 2. The driving mechanism 4 has a window 5 and a wire operating motor 6 connected to the window 5. The window 5 has an opening 5a which can be closed by a window frame 7. The window frame 7 is pivotally attached to the case 2. The wire operating motor 6, which is connected to the window 5 and the window frame 7, can be driven by a driving motor in the conventional power window apparatus. In operation, an up-moving operation, a down-moving operation, or a locking operation, among the operating modes of the window, is achieved by the driving motor as follows: Upon up-moving operation or down-moving operation, the window 5 is driven upward or downward along a guide rail 2a formed in the case 2, and the window frame 7 is rotated upward or downward along a guide rail 7a formed in the window f30f4ceada
