Universal Disk Image (UDRIP) is a freeware that helps you create disk images from a CD/DVD or ISO file. This kind of disk image can be used to create bootable CDs/DVDs. UDRIP is an open source application created by Software For Designers who want to read the contents of CDs or DVDs. It was also inspired by Microsoft PowerISO. Besides creating an image from a CD/DVD, UDRIP can also help you to burn an image to a CD/DVD. It can also convert a file from one type to another. For instance, it can convert an ISO file to CD/DVD image or an image created by Microsoft PowerISO and Iso2UDRIP can be used together. When you double-click an ISO image in UDRIP, it starts the CD/DVD burning wizard for you. This wizard is very easy to use, it just needs you to select a drive where to store the image and to decide whether to create bootable CD/DVD or not. UDRIP can be used to burn an image to a disc by using the built-in CD/DVD burning utility. This allows you to use a very intuitive interface, it doesn't have many options but it is fast and simple to use. It allows you to create both ISO and BIN images. There is no minimum size limitation for the size of image that you can create. However, it is only able to burn a DVD ISO image. If you need to burn a bootable CD, you will have to download the program 09e8f5149f

Picture-Desk Batch Converter [32|64bit]

Picture-Desk Batch Converter is a software with a pretty self-explanatory title - it allows you to convert image files in batch mode. But you can also perform other operations as well, such as resizing. The interface of the program is plain and simple to work with. Thanks to the Explorer-based layout, you can easily locate and import images for processing (the "drag and drop" method is not supported). In the list, you can check out the name, date of modification, type, size and containing a folder of each image file. So, all you have to do is establish the output destination and file type, in order to proceed with the conversion task. But you can also make image adjustments (e.g. rotation, resizing, convert to grayscale, contrast, saturation, color balance), add watermarks (text or image), as well as edit IPTC captions and EXIF information. On top of that, you can enable Picture-Desk Batch Converter to overwrite existing files, set a file renaming pattern, rename and copy files only, delete the source files, and others. The image processing tool requires a low-to-moderate amount of system resources, has a good response time, quickly applies modifications and manages to keep a good image quality after resizing and conversion. We haven't come across any issues during our tests. Unfortunately, there is no help file available and the interface is outdated. Other than that, we strongly recommend Picture-Desk Batch Converter to all users. What's New in the?

The GroupWise e-mail client has been a very useful and popular desktop client over the years. Like many other desktop clients, it's been plagued with bugs, constantly changing, and a dearth of fresh features. However, GroupWise 10.1 completely changes the game by adding some really useful and practical features. First and foremost, it's moving away from the buggy, unstable Groupwise 9.x client that was pretty well ratholed around the whole tech landscape. The name may be an aged one, but the new features and improvements in Groupwise 10.1 couldn't be more modern - even compared to that of the latest version of MS Outlook. One of the aspects Groupwise 10.1 brings to the table is support for hot-swappable storage pools. With this concept, users can easily add and remove storage pools as storage space becomes scarce, and as the server can add or remove servers at any given moment, the number of users and the amount of storage space is almost infinitely scalable without restarting Groupwise. This is, by far, the most useful feature for any IMAP-capable email client, like Groupwise. In previous versions, if you weren't logged into all the servers at the same time, it would show an error message like "the server is not available." This new feature allows you to add servers and log in to all of them from one place. It also makes it easier for users to make changes to add or remove servers, without having to manually switch between multiple servers. Another improvement is the Unified Repository. This is, indeed, a pretty exciting feature. The unified repository helps both Exchange and Linux users to synchronize all their data, including contacts, calendar entries, and address books. This is especially helpful for users who send email to multiple mail servers, especially Exchange mail servers. In other words, if you ever have used a tool like Thunderbird, and you send email to both an Exchange and a Yahoo mail server, you know how frustrating it is to deal with multiple conflicting e-mail address lists. The GroupWise unified repository makes it easy for you to manage all your data in one place. Now you can use the new Groupwise feature of being able to snooze an e-mail. You can hide an e-mail for later without deleting it from the server, and also change its status to something else, like unread, "to be read," etc. This is especially
