A: Having spent a good chunk of my high school life dealing with non-technically inclined people who had no idea what anything was actually called, it's my favourite kind of learning resource. One of my favourite short passages is from the Wikipedia article on Holographic Recordings: In more technical language, the way the perceived wavelength of a photon relates to the energy and frequency of the photon is frequency-energy equidistant theorem, which states that for every photon the energy (E) and wavelength (L) are related as  $E = c \cdot h \cdot L$ . So in this case, with the photon energy E and wavelength L being equal, the energy of the photon is exactly the frequency of the light. It's geeky and maybe not your thing, but it's a nice gentle introduction to how things actually work. Q: How can I only read a portion of a file using Perl's File::Slurp? I am using the Perl module File::Slurp and I need to read only a portion of a file. My original intent was to read the first 100 bytes of the file. I only want to do this once, and not on every page so I do not want to tie it to a page. How can I do this? A: You can use File::Slurp::read\_only to get a buffer from the file and then iterate over the part you want: use File::Slurp qw(read\_only); my \$data = read\_only(\$file, \$offset, \$length); foreach (split(//, \$data)) { print \$\_; } A: It sounds like you have a 1a22cd4221
