Hand counting is gaining popularity among commercial printing companies because of the reduced use of paper and ink. Specifically, it has been reported that a commercial printer can save about thirty to sixty percent of his total cost by switching from manual counting to a hand counting method, especially in the printing of large papers such as cardboard and wooden sheets. It should be noted that the term "hand counting" is applied to printing methods where an operator manually counts pages printed with a digital printing press. However, the term has also been applied to printing methods in which the operator manually inspects printed pages. In particular, a conventional method for hand counting of a printed page employs a system which comprises a platen, a drum and a hand held counter which is manually inserted on the platen between the drum and the platen. The counter then inspects an image printed on the platen and indicates the number of printed pages on a page basis. When the

Field of the Invention The present invention relates to the storage of information with a plurality of network storage device arrangements, and more particularly, to the storage and access of network storage devices from heterogeneous clients. 2. Background of the Invention A storage system generally includes at least one processor operably coupled to a storage device, such as a disk drive, optical drive, and/or other storage element. In these systems, a host can transfer input data to the storage device where it can later be retrieved. The storage device can be coupled to one or more additional storage systems. The storage device can also be coupled to at least one server (sometimes referred to as a "server"), which may be a system for operating on data with a processor. The storage device, server, and/or host can be operably coupled to a network, such as a local area network (LAN) or a wide area network (WAN). In many environments, a plurality of storage systems can be coupled to at least one server via the network. The servers can be used to act on, or otherwise operate on, data that is stored on the various storage devices. In some cases, data and/or metadata can be moved from one storage device to another. A server can also be used to generate certain content that is then served to one or more of the plurality of storage devices. Other servers can be used to distribute data that is stored on the storage devices to clients. The storage devices may be coupled to a fabric that permits multiple servers to access the storage devices. In this context, the storage devices and servers may be referred to as logically "movable storage." Various approaches have been used to effectuate such data storage and access. For example, a client may be configured to access a server, and the server may be operably configured to access a particular storage device. Alternatively, servers and storage devices may be configured to directly access other servers and storage devices. For example, a server may be configured to directly access a data source. Accordingly, it can be seen that a significant amount of processing 3e33713323
