– View topologies in tree or list mode – Add devices such as end devices, routers and switches to the project – Configure advanced settings such as DHCP and DNS servers, manually added IP addresses, monitor ports, and more – Export topologies as JPG or PNG files for printing, including graphs, notes and geometrical shapes – A list of all devices with their current settings – Console options for all types of devices, including single, simple serial or serial/console, virtual serial/console, console via

AUX, and virtual console with input and output – Monitor and view connection errors and current flow in live topologies – Configure port speed and duplex settings – Configure voice, fax and modems – Build complex infrastructure topologies with intelligent network devices – Configure a serial/console connection to devices, like switches, routers, and end devices – Save snapshots to files or to the project for reuse – Reuse snapshots to compare configurations with one another –

Add pictures, notes, and geometrical shapes – Start, suspend, stop or reload all devices and their console connections – Configure loopbacks, hubs, or splitters in routers – Create new projects – Add notes and geometrical shapes to the project – Configure routing protocols, such as RIP, OSPF, IS-IS, and others – Configure VLANs in switches and routers – Add end devices such as firewalls, wireless access points, and end switches – Configure SSL certificates and encryption modes

in a router – Monitor ports and change settings – Monitor network devices to prevent un-expected events – Add power switches and other end devices – Change access lists, MAC address filtering, and other security settings – Configure a network router/switch as a router – Configure advanced options such as DHCP, DNS, PPPoE, and more – Monitor all devices and connect to console – View device status and connection quality – Monitor and view connection errors – Configure IP address management in network

devices – Create and edit routing tables – Setup various routing protocols – Configure and monitor IP pools, including static and dynamic – Configure DYNMAP, RADIUS, and 802.1x authentication – Configure and monitor network routing protocols, such as RIP, BGP, OSPF, IS-IS, and others – Monitor packet loss and apply appropriate 1a22cd4221

1. GNS3 2. GNS3 Portable Hotspot Shield VPN is a free peer-to-peer VPN for desktop or laptop computer. We encourage users to use a firewall at the same time. Moreover, Hotspot Shield VPN as a proxy can help to make public Wi-Fi networks work like private Wi-Fi hotspot. Features of Hotspot Shield VPN Instant & direct access to selected websites Anonymous surfing on the Internet Locked IP address Great for making your

Internet connection anonymous Speed is at the highest level Gives complete access to your favorite websites Speed, security and anonymity combined in one app Use this app anywhere Gives you true, unblocked access to online content Free for personal, non-commercial use Easy to use, easy to install, easy to use 100% free, support and maintained by a team of high-level engineers How Hotspot Shield VPN works When you install Hotspot Shield VPN on your mobile device, the software

will install a native VPN client application on your device. Hotspot Shield will be set up to replace your default Internet browser with the native client application. All connections initiated through the native client application are encrypted by the Hotspot Shield servers, and are then routed through a secure encrypted tunnel to your Internet gateway. Encrypted traffic for both directions is protected by 2048-bit symmetric ciphers using AES and RSA algorithms, and is directed

over multiple secure sockets layers. When you surf the web with the application, Hotspot Shield will use the encrypted tunnel and virtual private network to protect your traffic. This method uses the existing ISP infrastructure for Internet traffic without the need of a proxy. So while you are using the internet, your device will be sending data through the VPN network and the internet, in that order. Browsing through Hotspot Shield VPN All browsing through Hotspot Shield VPN is just like any

other browser, but because it is a VPN, the connection will be encrypted and routed through a VPN tunnel to your Internet gateway. On your mobile device, all access to the internet and content is routed through the native VPN client application. When you connect to the VPN, your device will appear to be communicating with the VPN server. As you surf the web, content will be sent to your device through the VPN network and Internet, and not directly from

The advantages of a portable program This is the portable counterpart of GNS3 and therefore, the Windows registry and Start menu/screen will not suffer any changes. Another important aspect you need to take into consideration, is that you can

use GNS3 Portable on any computer you can connect to, by simply dropping the program files to a removable storage device, such as a USB drive, and clicking the EXE. The interface encompasses a simple design, with a menu bar, several shortcut buttons and panels, so that you can easily access all the available options. It can be used by power and novice users alike, as long as they have some knowledge of router and switches connections. Add notes, pictures, shapes, and more This software tool supports

many different types of routers, switches, and security or end devices. It is possible to also take snapshots of your project and save them to the hard drive, in formats such as PNG, JPG, BMP, XPM and PDF. Aside from that, you can view a topology summary, insert notes, pictures and geometrical shapes, as well as start, suspend, stop or reload all devices, and console connect via AUX to all items. The CPU and memory usage is moderate to low, which means you can use this app alongside

others without it affecting the way your computer runs. In conclusion Taking all of this into consideration, we can safely say GNS3 Portable is an efficient piece of software with enough configurable options, a good response time and a simple-to-use environment. It can be used to help you learn for certification exams such as Cisco CCNA, CCNP, CCIP, CCSP, CCVP and CCIE, Juniper JNCIA, JNCIS or JNCIE.
