Visual Batch is a small, handy tool specially designed to offer users a Batch File Framework for.vbat Files. This Public Domain language will compile executable exe files. Instead of Classes or Units of Available Commands, in Visual Batch each command is a separate binary exe that functions (GUI or Not) by how command line parameters are given to it when executed. This makes Visual Batch a custom language. Anyone can add a new command to it by programming or obtaining exe files that process command line arguments. It has with it some standard commands that help with tasks like ShowMessage, GetInput, MakeVar, etc. Once you have imported your commands and written your scripts in the IDE (Shown Below) you can compile the scripts and the command binaries that they use to a single compressed executable binary exe file, and it's as easy as batch scripting or.bat files. Visual Batch Features: Compiles command line commands. Compile them into single.exe files for your script. Compiles.vbat files. Compiles all commands in a.vbat file into a.bat file. Compiles.vbat scripts into.bat scripts. "More" is seen on the VIDEO COMMENTS for the sample exe. Visual Batch Features : CMD Commands for the IDE Used for editing and scripting purposes. Visual Batch v0.9.7 ------------------- Visual Batch has been designed to be simple to work with but to far the best I have seen. Visual Batch doesn't need a GUI for the most part. People are used to that... but for new users... a simple display of plain text, basic concepts and just a basic command palette makes it easier for them to learn batch programming. A really great addition to Visual Batch is the ability to print out the Visual Batch command editor. Users will be able to print/save/re-print the default IDE for offline use. I have also found with Visual Batch developers can create and use their own commands by simply exporting their custom made commands. Visual Batch can display.vbat Files, simple text, and text/values in many Text Areas on a Form. With the Add-on module you can select multiple values from drop-downs, edit sets of values from a form, and dynamically edit text areas. Some samples of what you can do with it include: Show default values for every item in a drop-down list. Show a list of values for each item in a drop-down list. Show a list of values for each item in a set of drop-down lists. Write a value from a form to a text area. Copy a text area's values to a set of text areas. Update a file's values in a text area with what's in another file. ... and more! There are four major add-on modules for Visual Batch: CBatch, a GUI Toolkit that allows you to edit a.vbat file, create a.vbc, import a command-file into a.vbat file, and dynamically edit a text area with different text values. CBatch_AddOn, a library of work-around Add-On modules that allow you to create a new command file, import a command file into a.vbat file, create a.vbc file for your command, and more. CBatch_TextView, a visual display module that allows you to view your.vbat file (as text) or edit it. CBatch_Collections, a module that allows you to create a.vbc file that represents a collection of objects, string values, or other items that can be embedded in a.vbat file. There

What's New In Visual Batch?

When you import a command you'll notice that the command has a unique name. It's the same name you could use to run the command (Command Line parameters) but instead Visual Batch will compile it into a separate exe. All commands start with an Initial or Reset option which can be any string. Initial If the option is an Initial then it is the default Command Line (Parameters) for when the new command is run. Reset If the option is Reset then it is the Command Line (Parameters) for when a command is run. Help If the option is Help then it is a help message to help the command's user understand it better. ShowMessage Shows a Message Window. This command is given a Title and Message as parameters. GetInput Obtains the last Command Line (Parameters) for the command. It then either returns a string of the command line to use as an argument or it returns Nothing for that line number. MakeVar Creates a Variable from the Command Line (Parameters). This can be used to gather command line parameters for a new command or to create new command line parameters. If you look at the top example below, you can see that there are 3 Initial commands in the Example. The first Initial command is "Hello World!" The second Initial command is a help message to help a user better understand command "Hello World!" The third Initial command is a help message for the "Hello World!" command. This example

also shows two Reset commands. The Reset command for command "Hello World!" has a help message that says "Hello World again!" The Reset command for command "Hello World!" is the default command that executes when this command is run without any Command Line Parameters. The Reset command for command "Hello World!" has a blank title. The Reset command for command "Hello World!" has a blank message. The Reset command for command "Hello World!" has a blank parameter. Command "Hello World!" has the parameter "Hello World!" where parameter is the name of the parameter in the command line. Command "Hello World!" has 3 text parameters The Reset command for command "Hello World!" has a help message that says "Hello World again!" The Reset command for command "Hello World!" has a blank title. The Reset command for command "Hello World!" has a blank message
