Application.ProcessMessages hangs indefinitely on High Priority applications I have a VB6.0 Application running in Windows XP. The Application starts during boot, but when WinMain() executes, it causes the system to enter the name of the application into the Task Manager. If that application is on HIGH PRIORITY or above, ProcessMessages will hang at the line Application.ProcessMessages() until it gets a response from that application. The application runs normally without a problem, it is just that the system hangs and must be rebooted to finish that application. If it is a LOAD BALANCED or BOOT AWARE application then it doesn't hang but it still hangs the system. Is there a way to tell the system that Application.ProcessMessages() does not have to process all the messages in the queue at once? A: The answer has nothing to do with VB6. Visually appealing, and easy to use You only get to spend a little while in the installer, with a few “next” buttons being enough to get you through. The visual design allows individuals of all levels of experience to quickly get the hang of things. Most of the space represents the edit area, which you can emphasize with elements like tab or space placeholders, end of line symbol, word wrapping, line numbering, bracket and word complete, spell checker, and even a syntax highlighter. Edit options, and programming language support Unlike most text editors, font options are not accessed from the upper toolbar. Instead, a properties side panel lets you switch between search, font, and color palette options to tweak visual options for selected, or entire content. What’s more, the search function is also fitted with a replace function. The application is not your average text editor. Sure enough, default features make it easy to create, and visually tweak text. However, programming is also encouraged, with support for languages like C#, C++, HTML, CSS, Java, JavaScript, PHP, Patch, Python, Ruby, SQL, TeX, VBNET, XML, and a few more. A few last words In conclusion, Poet is a flexible text editor which doesn’t necessarily emphasize a particular practice of text writing, but rather aims to be available for a larger variety. Basic text operations allow you to tweak the canvas, and text aesthetics, while programming languages support lets you finish, or start writing your projects. Any change you make directly affects the content, so you can perform changes or additions in one place, and immediately see the results in the results area. Once the window is set up, you can actually start your editing. Of course, you can work on your content in one of two ways. If you want to keep your tabs in a practical order, you can simply drag them around on the side. The other option, however, is to place the brackets, numbers, and characters
