
MySafePass Editor Crack+

MySafePass Editor is a free secure password manager. Unlike others, it is more about managing secure passwords, not just keep them safe. Once you add a new file to the database, it is secured by password. So when you open it again, it can never be tampered with - not even by superuser. Its also protected by screen lock. You can set a screen lock timeout in minutes and screen lock on non activity mode. Not even root can open it with password if he/she has not entered the password while opening. You can also use MySafePass Editor to keep other passwords, IDs and such stuff confidential. But MySafePass Editor is not a good option for storing confidential information because Password typed while saving is not password, but generated by secure algorithm. Password which is entered when opening a file is not the real password, but generated by secure algorithm. Password is saved only to a very safe place with minimum permissions. Password is never shown anywhere on screen. Password is not memorable due to secure algorithms. Password is never saved to disk with DOS file functions. In addition, using MySafePass Editor gives a lot of handy controls and utilities. You can easily disable/enable/lock/unlock/move/remove/reverse multiple of files at the same time. You can also protect/unprotect groups of files. Besides, you can easily make backup copies of any document. You can even forward any mail by simply clicking button. If you are using the version of MySafePass Editor for Windows, you can use MySafePass Editor in your own custom applications. MySafePass Editor Version History: Version 1.0.4 (25/07/2010) Renamed the application from MySecure Password to MySafePass New features: Completed on Win32 Added Group protect and unprotect a group of files. Added Move/copy a group of files to another place at a single button click. Added print the status of the secure on/off with customizable status message. Added a send email option in the Send tab. Moved details of password and password type in Message box. Moved the "Delete all the information in this password" question in the warning box. ◆

What's New in the MySafePass Editor?

MySafePass Editor uses modified 256-bit AES encryption with a key that it is generated from the password you supply while saving/opening an encrypted file. Ex: [sfpass FILEFILENAME] Now, we will see how to encrypt a file using SF Password Manager and open it using MySafePass Editor. STEP 1. Create password manager (SF Password Manager) and safe file (MySafePass Editor) 1.1. Create an SF Password Manager. It will store all our passwords in files with the extension.sfp (it allows up to 16 password groups with 16 distinct password holders per group). To do this, choose File | New Password Manager... 1.2. Click OK 1.3. In the Password Manager window, click Next and follow the onscreen prompts. Then, click Finish to exit the Password Manager. 1.4. Type a name for the folder where the Password Manager is created. Select a folder and click OK. 1.5. In the Password Manager window, click the plus symbol (+) to create a new empty password group. 1.6. Type a name for the password group in the Password Group box of the Password Manager window. 1.7. Click in the Password Holder box. In the Password Manager window, select an empty password box. 1.8. Click in the Password Manager window, select a password box, then type and save a new password in the Password Manager window. 1.9. Click OK to save the new password to the password group 1.10. Click OK to save the Password Manager window and exit the wizard. Now, you've just created an SF Password Manager. 1.11. Create a text document using any text editor. Save the document and name it MySafePassEditor (the.txt extension is optional). 1.12. Open the SF Password Manager and click the plus symbol (+) to create a new safe file. 1.13. In the Save As dialog, type MySafePassEditor. 1.14. Click OK. 1.15. In the safe file window, click the plus symbol (+) and select a new safe file. 1.16. In the Save As dialog, type MySafePassEditor. 1.17. Click Save. NOTE: You can add more safe files by following Steps 1.13 to 1.16. 1.18. Open the SF Password Manager. Click the plus

System Requirements:

Windows XP and Windows Vista Windows 7 8GB system RAM minimum 1024x768 screen resolution at least At least 500MB storage space in %appdata%/ThinkPadAurora/ Adobe Flash Player 9 or higher is recommended Mac OSX 10.5.1 or higher Windows 8 At least 500MB storage space in %appdata%/ThinkPadAurora/
