The Present-A Review of the Past. The history of

present-day research on GABAergic transmission and its modulation is reviewed by starting with the discovery of the role of GABA in the central nervous system and following with the subsequent discovery of the mode of action and function of GABA receptors. The presentation is structured in three parts: i) the general concepts of GABA action and intracellular signaling; ii) the discovery of receptor subtypes and ligands; and iii) the development of technology and the progress of the receptor field. Efficacy of paliperidone extended release (ER) versus risperidone for the treatment of schizophrenia in patients with treatment-resistant schizophrenia. As part of a comprehensive assessment, patients with treatment-resistant schizophrenia were randomly allocated to paliperidone ER or

risperidone treatment groups. The primary efficacy variable was the Positive and Negative Syndrome Scale (PANSS) total score change at study endpoint relative to baseline. A total of 59 patients completed the study: 31 (77.5%) in the paliperidone ER group and 28 (66.7%) in the risperidone group. Significantly more paliperidone ER-treated patients than risperidone-treated patients showed both significant improvements in PANSS total and positive subscale scores at endpoint and reductions in PANSS negative subscale scores from baseline to endpoint. Although paliperidone ER was generally well tolerated, significantly more paliperidone ER-treated patients (45%) than risperidone-treated patients (23%) experienced adverse events. Dry mouth and insomnia were significantly 82138339de
