Stardot Remake AFFILIATE PROGRAM About s is a best product to get free soccer and baseball umpires books. After that, the user can change the color and size. As for the download link, it is already given at the end of the page.Q: How can I change the contents of a UIView.contentView in MonoTouch? Is there a way to change the value of a UIView.ContentView? I need to do this because I am using UIView.ContentView as a way of

making my view interact with a previous view. But when I change the content view, it causes my view to redraw. This is why I am reluctant to changing the ContentView, but I need to do so. One solution is to override the Control.Update() method of my UIView, but this does not seem to be possible (at least with a MvvmCross view I am using). Another option is to set my view's ContentView property directly in ViewDidLoad, but this is exactly what I am trying to avoid. Any ideas on how to update my view without

this massive redraw? A: The view has to refresh itself when you change its `ContentView` property. But if you're trying to update the view on another thread, it's better to modify it on the UI thread using the dispatcher. This would cause you no refresh, and you wouldn't have to worry about who might be changing the view on another thread. And it would be a different implementation from your current approach. What `ViewController.ViewDidLoad()` is doing right now, is executing an action in the

UI thread, which will in turn dispatch a background thread to update the view.

```
void Update() { // code that changes the  
view contents. } void
```

```
ViewDidLoad(object sender, EventArgs  
args) { BeginInvoke(new
```

```
Action(Update)); } If you want to
```

modify this and keep the view updating itself automatically, you'll need to do a bit of work to keep track of the

reference to the UIView. A simple workaround is to set the ContentView property to a new instance of UIView.

The problem with this approach is that

the new UIView is not added to the
UIView.ContentView. If 82138339de
