The Luminance Sensor Simulator by photo-circuits.com allows you to calibrate your luminance sensor. "Figure the real luminance, convert it to a percentage and find out the best luminance reading you can get." What's New: This update introduces several bug fixes and enhancements. - The field range has been extended from 0 to -1.0. Now it can be used to calibrate any camera. - The calibration target options have been changed to be more consistent. The old selection should be removed and replaced with a new "Standard Target" selection. - Color temperatures have been adjusted to match the new color temperature range. The default temperature of 5000K has been changed to a new 5510K. This should eliminate problems with the older green screens. - A reset has been added to allow for more convenient repeated calibrations. The following behaviors have been changed to be more consistent. - The default lens light level has been increased. - The default shutter speed has been decreased.
