GRAVITY ALPHA is a reliable application that enables you to calculate and view the effects of gravitational attraction between two objects, based on their dimension, mass and density. The software enables you to set the parameters of two objects, set the average speed, then start the movement simulation. Preview sphere trajectory and rotation Based on object parameters, the software can easily calculate the rotation trajectory of the lighter object around the heavier one. You simply need to set the values, for the object's properties, such as three-dimensional size, mass, density and gravity force. You may also add textures and make the objects look like planets, atoms or random spheres. You may manually enter the object data or load a template file that contains the set of required values. Several separate menus allow you to set the object's impulse, movement duration and object layout. Thus, the impulse is calculated as speed (meters per second) times mass (kilograms), while time can be estimated as microseconds, seconds, hours, days or years. Calculate trajectory and view movement The View dialog box allows you to apply a pattern to the spheres, by loading an image file for a specific object. You may set the sphere scale between 1 and 9999, in order to determine the size of the objects on the display. Additionally, you may choose to view the entire scheme or just certain elements: axes, lines, trails and objects. Once you have set all the desired parameters, you may start the playback and watch as the program applies the gravity effects on the movement of the spheres. You may view the rotating ensemble from the zero point, or you can focus the display on one of the two objects. Science project assistant GRAVITY ALPHA is a useful digital assistant in science projects, for students, hobbyists and professionals. The software is lightweight, simple to use and the view can be switched from window to full screen with one click. The menus can stay on the screen, for easy access, but you may also close them without losing the current configuration. Moreover, you can save the current values to a text file, and load it at a later moment. GRAVITY ALPHA is a reliable application that enables you to calculate and view the effects of gravitational attraction between two objects, based on their dimension, mass and density. The software enables you to set the parameters of two objects, set the average speed, then start the movement simulation. Preview sphere trajectory and rotation

- Calculates the rotation trajectory of the lighter object around the heavier one.
- Allows you to manipulate the objects' position and speed, add textures and make the objects look like planets, atoms or random spheres.
- Calculates the trajectory of the objects as they move.
- Allows you to control the view of the movement by switching between the objects or the full window.
- Allows you to change the color of the objects by loading an image file for the specific object.
- Allows you to save the current values to a text file, and load it at a later moment.

The use of computer technology in our daily lives has led to the integration of computers and the Internet into our daily routines. A wide range of use of computer technology has become standard practice, including computers, and computer-like devices such as tablets and smartphones. NON STOP WEATHER is an easy to use, all in one weather application that gives you instant and reliable weather forecast. The application is very easy to use, where you can create a saved weather forecast or use one of the predefined saved forecasts. Current weather, long-range weather, daily weather, weekly weather and monthly weather are all included. You can choose from seven different views for your weather forecast. See current weather, radar, satellite, weather map, local weather map and a temperature graph. Weather radar is a very useful feature that shows different weather elements. Weekly and monthly forecasts are very detailed and include a time list, a temperature list, a rainfall list, a wind list, a heat list and a snowfall list. You can also save your weather forecast to a file. The application includes many features and you can easily create, save and share your forecast. Key features:

- Variety of forecasts and views
- Seamless transition between screens
- Instant weather forecast
- 14 day forecast, daily forecast and weekly forecast
- Seven different weather views.
- Weather radar
- Weather map and local weather map
- View temperature graph
- Seven different color themes.
- Save weather forecast to a file.
- Save preset weather forecasts to your library.

Tag Search Tag Search allows you to search for tags on your media, music, photos, etc. You can search for all tags related to a specific artist, song, album, genre, title, or album artist. You can also search all tags that belong to all of the selected tags. You can select 1a22cd4221

An application that allows you to create and visualize the effects of gravitational attraction between two objects. The dynamic influence of the gravity on moving objects is calculated based on their parameters, such as dimensions, mass, density and speed. You may also simulate the movement of planets, atoms, molecules, electron clouds, galactic waves, or any other objects. You may control the size, dimension and color of each object. You can define the trajectory of each object and calculate its rotation, based on their different settings. You may apply texture images and control the view to see the entire scheme or a certain element. You can save the current configuration to a text file, and load it at a later moment. The program has a simple interface and its results can be viewed directly. It is a handy software for students, hobbyists, professionals and people with no previous programming experience. Testimonials: GRAVITY ALPHA is a digital assistant that allows you to create a model of the effect of gravity, based on your basic knowledge of science. It also allows you to easily calculate the trajectory and rotation of a lighter object around a heavier one, using the built-in physics engine. One of the most impressive applications is the possibility to create multi-dimensional simulations of objects, based on a simple input file, in the form of a vector image, and of a text file containing the parameters required for the simulation. A template file may also be used to speed up the simulation process. Another interesting feature is the ability to save the current configuration to a text file, and load it at a later moment. The software is ideal for visualization of the influence of gravity, and calculation of movement, on a single object or on objects in a multidimensional space. It is an excellent solution for those people who are new to software programming and who have no prior knowledge of this field. System requirements: Any windows operating system 30 MB of available disk space 1.33 GHz Pentium 3 or equivalent processor 1 MB of memory 3.0 MB of free disk space Microsoft.NET Framework 1.1 or higher Ethernet Description: This is a free computer software with a user-friendly interface. The program is meant to provide an easy-to-use and fast way of visualizing gravitational effects on different objects. AimSoft SuperVector is a 3D vector graphics software with a user-friendly interface that will allow you to easily create and edit 3D vector graphics objects for various purposes.

What's New in the GRAVITY ALPHA?

GRAVITY ALPHA is a reliable application that enables you to calculate and view the effects of gravitational attraction between two objects, based on their dimension, mass and density. The software enables you to set the parameters of two objects, set the average speed, then start the movement simulation. Preview sphere trajectory and rotation Based on object parameters, the software can easily calculate the rotation trajectory of the lighter object around the heavier one.
