If you have some web design experience and want to make changes to an HTML document quickly, then you'll love HTMLEdit for Windows. Our native HTML editor is the simplest HTML editor to use and it comes in a portable package so you can take it with you. The best thing about HTMLEdit is its editing is very intuitive. You can create new documents, edit existing HTML documents, edit existing HTML files, preview the HTML code and configure. HTMLEdit has the following features: • Create new documents • Edit existing HTML documents • Edit existing HTML files • Preview the HTML code • Configure • Show and Hide the HTML Code • Open Clipboard • Convert Character Entities to Character Codes • Paste Character Entities • Copy Character Entities • Convert Multiple Entities • Convert Multiple Entities to Character Codes • Search and Replace Text and Dictionaries • Save Selected Text, Formatting, Syntax Coloring • Print Selected Text, Formatting, Syntax Coloring • Export Selected Text to a file • Export Selected Text to a file • Export Selected Text to a File • Send Selected Text to the Clipboard • Configure HTML Encoding • Configure Tag Naming • Configure Tag Naming for Languages • Configure Tag Naming for PHP • Show Script Info • WYSIWYG HTML Editor • Link Checker • Link Checker for XHTML • Link Checker for XHTML with lots of Links • Website Browser • CSS Editor • CSS Editor with lots of Stylesheets • CSS Editor for Cascading Stylesheets • CSS Editor for Preprocessors • CSS Editor with Declaration Support • CSS Editor with Declaration Support for Preprocessors • Tidy View • Put Word Wrap on • Highlight Duplicates • Highlight Long Lines • Disable CSS Properties • Disable CSS Properties • Black and White • Add a Dictinary to the Current Font • Add Nested Dictionaries • Add Unicode Characters • Remove a Dictinary from the Current Font • Remove Unicode Characters • Copy Character Entities to the Clipboard • Copy Character Entities to the Clipboard • Set Character Codes to UTF-8 • Set Character Codes to UTF-8 • Add a Font • Add a Font • Change Font Color

Create and edit HTML files on any PC or a web server You can save the downloaded executable file in a custom location on the disk, or keep it stored on a USB flash drive, and just click it to launch HTMLEdit effortlessly. It doesn't need any DLLs, make any changes to the Windows registry, or create extra files on the disk without your permission. It's wrapped in a plain and simple interface that looks like a regular text editor. Because it doesn't contain rich features, the available options are rather intuitive, even for users with minimal web design experience. Syntax highlights and design preview You can create a new document to write HTML code or open files to check out the code, view syntax highlights, make any modifications, and preview the design in another pane, including images. The HTML source and preview panes can be easily toggled with a hotkey. As far program customization is concerned, it's possible to customize color when it comes to the background, breakpoint text and background, comments, error text and background, execution text and background, normal text, numbers, preprocessor, selected text, margin and background, strings, tags, tag parameters, and whitespace. The list with tags taken into account for syntax coloring can be customized by removing any entries or adding new ones. These settings can be restored to default, while the new code can be printed, overwritten to the original file, or saved to a new one. Evaluation and conclusion Although the tool hasn't been updated for a long time, it worked smoothly on newer Windows editions in our tests. No error dialogs popped up and it didn't freeze or crash. Unfortunately, HTMLEdit doesn't implement a basic word wrapping option, making it difficult to view and edit long HTML code. I have used HTMLEdit in the past, and it was a breeze to use. While the web design process is back in my head, I can't seem to find a way to get this program to update my files. I've added, removed, and edited code on my own time, but when I try to view it in HTMLEdit, it just updates it as I would expect. I'm not clear as to why it would save the same old HTML. To me, that means that I have to re-create it, then save it again. And of course, this is what the program is supposed to do. It works, but I'd really like a more reliable editor for quickly creating a website. It Works, but... I have used HTMLEdit in the past, and it was a breeze to use. Whenever I go to run the app it runs perfectly fine - the Login works and my main view loads. However if I delete this scene and add a second Scene, delete the Main class and add another class - I receive this Error: Exception in thread "JavaFX Application Thread" java.lang.reflect.InvocationTargetException Caused by: java.lang.NullPointerException How can I get JavaFX to create a new Scene if I have a different Controller class than the one I have in the Scene Builder?? A: You can not force JavaFX to create a new scene or start a scene from a scene builder. JavaFX Scene Builder just allows you to create and add controls to the scene, in your case you just have to open the FXML file with the JavaFX SDK.
