Note Most image-editing programs let you add a new blank file, called a new document, from the File menu or by selecting New from the Edit menu. 3. **Select Edit** → **Fill**. Adobe Photoshop opens the Fill dialog box. There's no point using this tool if your photo has no greys, since there's nothing to fill. If you want to see what Photoshop sees when it tries to fill a black area in your photo, try the eyedropper. 4. **Place the eyedropper tool over the area you want to fill**. The Photoshop Fill dialog box, shown in Figure 1-2), appears in the lower-right of the screen. In Photoshop, a dialog box usually means that you need to read a setting, such as the value of a dialog box item. FIGURE 1-2: Click the eyedropper tool to make the Fill dialog box appear. Here's a breakdown of the options in the Fill dialog box: * **Radius**. This setting lets you narrow or widen the selection that Photoshop makes. Try it; you may not even know your setting is there. * **Blur**. You can add a little blur to an image, just like blurring a camera lens. To blur an area, select the Blur tool (it's a bright green squiggle). Then drag over a window-sized area of your picture to blur it. This setting is available only if your image has a layer with a visible blur filter. Otherwise, your entire file is blurred. * **Opacity**. You can control the transparency of the fill by selecting this option. * **Color**. This setting lets you select a color you can use to fill the selection or paste the color as the fill. * **Preview**. If your image contains any layers, you can click this button and see a view of the image with the selection and color you selected. Now that you understand some of the different fill options, let's take a look at how to execute some common Photoshop fill tasks. ## Applying a Brush Photoshop has a large number of built-in

Injection of botulinum toxin type A in the first 4 years of life results in functional impairment in the upper extremities: a 5-year follow-up study. The authors investigated long-term outcome of children (n = 185) treated during their first 4 years with subcutaneous injections of botulinum toxin type A (BTX-A) for cerebral palsy. Assessment was by history, clinician examination, semiquantitative, and objective measurements. Children injected bilaterally with type A BTX-A for spasticity improved in musculoskeletal functioning, strength and endurance, manual ability, hand position, gait, and walking ability. Outcome was satisfactory in many children. Functional disability was related to the higher degree of spasticity. BTX-A treatment of the upper extremities is beneficial for the children; most children with satisfactory outcome are found among the spastic children and those treated early during the first years of life. Early treatment of cerebral palsy with BTX-A for spasticity may be important. Oocyte-specific RNA polymerase II. The zona pellucida protein ZP3 is required for fertilization, and recent studies suggest that its function may involve the synthesis of early embryonic mRNA. Here we have isolated a clone encoding the unique subunit of ZP3 (ZP3A') using a PCR-based strategy. The 804-bp insert contains an open reading frame (ORF) encoding a 69-kDa protein similar to the known components of eukaryotic RNA polymerase II (POL II). ZP3A' was readily identified in somatic tissues and was present in the early embryo, starting at the 8-cell stage and continuing throughout compaction and blastocyst formation. Using RT-PCR, we identified the subunit in the mouse ovary and oocyte. The ZP3A' subunit was isolated using cDNA encoding full-length ZP3. Subsequent to the cloning of the ZP3A' ORF, the cloned cDNA was expressed in a baculovirus and used to raise antibodies against the recombinant protein. The polyclonal antibodies gave a marked immunostaining in the oocyte nucleus, and a positive band was seen in the ZP3A' immunoprecipitated sample. Aberrant CpG island hypermethylation of the BRCA1 tumor suppressor gene in primary squamous cell carcinomas of the uterine cervix. The BRCA1 gene plays an important role in the control of DNA repair and cell cycle control. Recent studies showed that aberrant hypermethylation of the BRCA1 gene is a frequent event in the occurrence of many human malignancies. We investigated the methylation status of the BRCA1 gene in 59 primary squamous cell carcinomas of the cervix and in their corresponding normal tissue. The methylation status of the BRCA1 gene was determined by restriction analysis with HpaII and MspI of a 3.8 kb fragment located in the 5' region of the gene. In the normal cervical epithelia, no significant methylation of the BRCA1 gene was found. Conversely, the BRCA1 gene was frequently methylated in primary squamous cell carcinoma of the cervix. Methylation was found in 33/59 (56.9%) cases and was not associated with histological type, International Federation of Gynecology and Obstetrics (FIGO) stage, lymph node metastasis, or distant metastasis. Methylation was significantly higher in women older than 50 years (P = 0.002). Hypermethylation was also found in three (5.1%) of 59 matched lymph node metastases. Our findings provide evidence for a role of aberrant CpG island hypermethylation of the BRCA1 gene in the carcinogenesis of the cervix. Q: How do I figure out when to use `ts.forEach()` vs `ts.forEach()`? From the documentation: `forEach` is useful for shallow iterators, where it's fine to apply the function to elements, but not to iterate over the iterator. This is a great case for `forEach()`, but not for `(for...of)`. `forEach` has some subtle and annoying semantics compared to `for..of` when used with a non-iterator: It works with any iterator, but not all iterators support `forEach` (and vice versa). It calls the iterator's `next()` method if it's not already done. It always binds by name, not by position. When should I use `forEach()` vs `for..of`? How does `forEach()` work differently that I'd have to be careful in using?
