This is a cross-platform application designed to automate the interaction with graphical user interfaces (GUI). In other words, this tool provides you with the ability to control an application using screenshot images and the Python scripting language. With Sikuli IDE, you can capture a snapshot of a GUI element, execute actions on the target interface and easily send a command to any program running on your computer.

Features of Sikuli IDE The application provides a list of commands that can be found in the left side of the interface, enabling you to control any of the objects that are visible on the target interface. You can perform actions depending on the location or type of an element, such as clicking, dragging or right-clicking. It can also wait for a certain GUI element to appear, so that the code you are automating will wait for the right element to be displayed. However, you can't use Sikuli

IDE to control a running application. If the system is paused, the application will not be frozen or suspended until you manually remove the Sikuli IDE from the system. The application is not difficult to use. Beginners should only require a few minutes to get to know all the available options and navigate the GUI. The documentation is quite detailed and simple to understand. For more advanced users, the interface offers a set of options enabling to control the application's appearance, the system-dependent elements of the interface, the operating system and system information, detailed data about the graphics card and the active monitor. Limitations of Sikuli IDE Sikuli IDE captures a snapshot of the whole screen and focuses on the element you want to control. It is not possible to select individual GUI elements. You cannot control the running applications. Precision of Sikuli IDE For this application to work properly, the target interface needs to be accessible by the operating system and GUI components have to be displayed. Compatibility of Sikuli IDE If the target

interface is not accessible, the command will not be performed. Q: How to get django form working with a Variable dictionary Hi I am trying to get form handling working with a variable dictionary. The purpose is to give the user an option in the form to give a range of numbers for a sort of ticket system. I want the form to accept the dictionary so I can create a dynamic number of rows for the form. Dictionary Variables are great for dynamic fields like

`{{ dict_values.type }}` but I can't get django to accept `{{ dict.A }}` or `{{ dict.B }}` Any Ideas? I would post code but I have none. A: You can use the `{% for %}` template tag to iterate over a dictionary: `{% for key, value in dict.items %}`
`{% endfor %}` You can also use the `{% with %}` template tag to get a similar effect:
