I have a function that calls a server and gives me the result as an array of objects. The problem is that I need the objects to be ordered by their serial number so that I can merge them all into one array (this is because I can't get the entire resultset in one go). I know that I can use ksort to sort the array according to the '\$1' key, but that will sort the array by the key of the \$1 of the array, whereas I need to sort it by the value of the \$1 of the array. How do I do that? A: This won't work: `array ksort (array &$a) { foreach ($a as &$_key => &$_value) { if ($_key == '1') { ksort ($_value); } } return $a; }` But it will work if you're just using the [1] key for your sorting: `ksort (array_values ($array));` And it will work if you have a specific value for the [1] key, rather than "1": `ksort (array_values ($array, 0));` Post navigation The top things you need to know ald647c40b
