Adobe Photoshop tutorials Note: These are only tutorials for the Photoshop CS2 version of the software, though the features may be familiar or accessible in the newer CS3 version as well. Many of the tutorials are from the CS2 version, so if you find that you need to buy newer tutorials, check which version the tutorial covers. Some tutorials, such as Photoshop for the Web, are written for Photoshop CS4 (but work with previous versions as well). Learn to use Photoshop and open it by doing this tutorial or that. Just read the headings of each topic and follow the instructions. Once you've completed the tutorial, take some time to play with some of the new features in Photoshop. Let's take a look at some of the tools and features in Photoshop. There are many tutorials and tips on the web to help you learn to use Photoshop. Try them out, and remember: Your first few attempts to use Photoshop may not be successful. But the more you work at it, the more you'll find out about the program's tools and features. See the Using Photoshop CS2 tutorial for ideas on learning Photoshop's basic features. Photoshop's Tools Everyone knows about the tools that come with Photoshop. The tools are called Brush, Lasso, Pen, Gradient, Pattern, and Text. It's not until we dive deeper that we see just how much the tools can do, however. Photoshop's Brush tool is probably the most commonly used tool in Photoshop. With the Brush tool, you can paint (or trace) on a layer (or layers). You can use simple brush settings, such as angle and size, or you can set up a paint brush. You can make patterns of different angles and colors. You can

create a brush from another object in the photo. You can use a brush to create and shape objects. Photoshop provides a toolbar of tools with the Brush tool. Many of these tools are similar to tools in other programs. For example, the Brush tool can be accessed through the Select, Eraser, and Paint tools. If you turn on the Lock/Wrap mode, you can use the tool to select areas of the page, then trace the areas that you select. One of the trickier parts of working with the Brush tool is learning how to select. There are many places to click to select an object, so it takes practice to select the area you want to paint. or off. Maybe the programmer didn't realize this, or maybe it's something more complicated. Context Running this, whether on my computer or your computer, will probably work. It probably will work only on computers with reasonable security settings. If somebody puts malicious code in your game then it's not very likely that it will trigger in the first place. So if you're worried, don't be. Not everything will work, and often it will fail silently. An easy way to test whether or not your game could be hacked is to add the following code to the game's main loop. `if (program.kernel.getDebugger()) { /* code we care about */ }` The first line will simply check whether or not the developer's code is executing. The second line will check to see if a debugger is running. Since a debugger will only launch when you're performing certain operations, if you get false for either of those, you can safely assume that the code isn't executing. This assumes you only have one debugger running. If a debugger is active and the code execution line returns true, it'll skip the remaining code. If you have multiple debuggers running, you'll only have to worry about one of them being malicious. It's possible to detect that the game is being debugged by catching the `Debugger.isDebugging()` method, and it's also possible to detect that a debugger is being used by catching the debugger's `Execution.isDebugging()` method. To detect if a debugger is active from your main loop, though, you can just create a quick boolean variable to hold the result of any calls to those methods. The last line of code will print out "debugger detected!" if either of those methods are executed. Conclusion Programmers don't care about you or your code. They want to make their game better. It's difficult to convince a programmer to implement a solution when there isn't a market for it. If there is a market, they're probably not going to do it. They know that people will be able to game exploit it, and they'd rather not try to address it. They figure they can work around it somehow. If nobody is looking for this functionality, though, you're free to implement it. If you already have a web server, a database, and a scripting language, it's just a matter of writing some code and making sure
