3D support There is a 3D drawing format that supports the majority of the line drawing commands, such as line, arc and spline. This format is however quite limited, as most of the commands that are directly applicable to 3D objects are not supported. For example, the command to insert a hole in a solid body (such as the command Insert a Hole) is only available in 2D. To create a 3D solid body, such as a cylinder, you need to either draw a 2D solid body and add the third dimension (the z-axis), or sketch the solid body and insert an extruded shape (the 3D object command). When drafting two-dimensional (2D) drawings, such as a map or a schematic, the 2D Drafting utility can be used to create the drawings, and after the drawing is

completed, it can be easily converted to 3D. 2D Features There are two types of 2D drafting utilities: Drafting utilities and 2D drafting tools. Drafting utilities Drafting utilities enable the user to create 2D drawings by selecting, organizing, and editing drawing objects. Drafting tools Drafting tools enable the user to select drawing objects, edit their properties, and draw them. These tools can also be used to convert 2D drawings to other formats (for example, 2D to 3D). Another type of drafting tool is a wireframe or wireframe drawing tool. This tool can be used to draw line-based and polyline-based 2D objects. In addition, there are a number of 2D drawing conventions that provide a visual framework for the drawing. These include title blocks, legends, coordinate systems, title blocks, blocks, grids, and titles.
