Graphic design software application released in September 2009, Adobe Illustrator is available as both desktop and mobile apps, and as a web-based application. Developed by Adobe Systems, Illustrator was originally available as a desktop drawing application used by graphic designers, and from 1995 also as a software application for the Macintosh platform. CAD, drafting, and graphic design software is no longer required in the same commercial environment that they were developed for. However, they are still widely used for a range of design tasks in fields such as architecture, construction, and automotive engineering.

History Before the introduction of computers in design workstations, commercial CAD applications were released to the public in the early 1960s by two of the pioneers in CAD, John Warnock and Stephen Wynn. The original application was designed for the Burroughs B1700, released in 1964. In 1967, Warnock and Winokur were joined by their business partner, Roger Gregory, who started his own development company, ComputerDraft. They developed a new application, called ComputerDraft 2, that allowed for the combination of text and line drawings in a compatible format. Autodesk started in 1982, with a single product, AutoCAD, an innovative desktop, non-proprietary CAD system for the PC. It was released for Microsoft's MS-DOS and Microsoft Windows operating systems. A major change that began in AutoCAD 1984 was the introduction of project-based design. Adobe introduced Illustrator in September 2009 as a web-based application for graphic designers and illustrators, and a desktop application for the Mac OS, as well as mobile apps for iOS and Android platforms. Its predecessor, Adobe Photoshop, had been introduced in 1994. CAD is defined as the use of computing to generate or modify representations of three-dimensional objects. CAD software is used for analysis, design, and fabrication of three-dimensional objects. CAD data is a file format. CAD file formats consist of a set of instructions to the CAD software (often a command or a series of commands) for generating and modifying a specific representation of an object in 3D. CAD systems are designed to support the concept of a project, with each project being represented by a model. A CAD model typically contains a collection of geometric primitives (lines, polygons, surfaces and solids) that represent the object to be designed. A model is divided into a collection of layers that can be processed independently. These

Processes Workflows are executed using a command-line interface that supports pipelining, scripting and branching. Windows, Mac OS X and UNIX users can automate workflow processes using API, C++ and Java. The command-line is very versatile, allowing the user to execute any command or series of commands by simply typing it in the command-line of a workstation or on the command line of an application. Using command-line interface, AutoCAD enables the user to perform the following:

- Navigation** The command line navigation allows the user to perform the following:
 - Performing any type of drawing operations From a single command line; all the drawing operations are automated.
 - Run multiple commands in a pipeline; all the commands in pipeline will be executed as a single action and after completion it will go to the next command.
- Pipelining**; An order of execution is specified, where each command in the pipeline is executed one after another, with the execution of each command being dependent on the completion of the previous command.
- Command-line mode**; Allows automation of drawing operations from a single command line.
- Submenu-based navigation**; Allows the user to go to a particular point in the command-line menu.

Automation of drawing operations in AutoCAD

Selecting objects The following steps are used to automate drawing operations: A call to a command to select the objects

The following steps are used to automate selection of objects in AutoCAD:

- A call to a command to find the objects
- Select the required objects and the Command-line cursor follows the selected objects.
- A call to a command to deselect the selected objects.

Further steps are used to automate drawing operations.

Zooming or panning The following steps are used to automate drawing operations:

- A call to a command to center a zoom or rotate a scale.
- A call to a command to position the origin.
- A call to a command to find the objects.

Zooming and Panning in AutoCAD are implemented as follows:

Center a zoom The following steps are used to automate drawing operations: A call to a command to center a zoom. A call to a command to create a scale. A call to a command to find the objects.
