Chromatographic and mass spectrometric characterization of the binding of cations to hydrophobic interaction chromatography media. The binding capacity of the medium depends not only on the charged surface of the column but also on the type of the ionic analyte. Hydrophobic interaction chromatography (HILIC) is a generic term used to describe chromatographic techniques that incorporate a hydrophobic stationary phase, potentially driven by electrostatic forces. In this study, we have investigated the binding characteristics of the HILIC-type stationary phase, namely C<sub>19</sub> reversed-phase high-performance liquid chromatography (HPLC) media, and its interaction with three different cationic analytes: multivalent anions (salts), cations, and protonated cations
