Structured Design formats Architectural CAD formats AutoCAD Building Information Model (BIM) – used for architectural drawings and construction drawing. AutoCAD BIM support is installed on most versions of AutoCAD. AutoCAD Civil 3D – is a 3D modeler for civil engineering and architectural design. Civil 3D is a 3D modeler that was first introduced in 2003. It is based on architecture and engineered product design. Civil 3D can import and export 3D BIM models. Civil 3D 360 Degree Viewer – is a feature that lets users connect to and view 360° views of Civil 3D models from various web browsers. It provides the means to create panoramic images from 3D models. This is done using a virtual camera built into the viewer that is connected to the model via a geometry link (created using the Virtual Camera tool). AEC drawing formats AutoCAD Architecture – is an architectural visualization program for a wide range of architectural design projects. It can handle most architectural components, and features an easy interface, and a suite of special architectural drawing tools. AutoCAD Electrical – is a professional electrical design program. It supports all major electrical applications from the U.S. electrical code to IEC and international standards. It has many special tools and features that make electrical design easy. AutoCAD Electrical MEP – is a professional electrical and mechanical design program. It supports the mechanical design of buildings and processes. It also supports the electrical design and construction of mechanical equipment for the building. Q: Using `HashMap.containsKey` in Java, compared to Perl While studying a book on Perl, I came across this snippet of code. `foreach (@ARGV) { $lines{$_}++; if (exists $lines{$_}) { # This code is equivalent to: # if ($lines{$_} > 1) { print "$_ : $lines{$_} "; # } } }` In Java, I came across this snippet. `for (String line : lines) { int counter = 0; if (map.containsKey(line)) { System.out.println(line + " : " + map.get(line)); counter++; } }` I'm puzzled by the second snippet of code. What does the `if` statement do, and how does it differ from the first snippet? A: The first snippet is simpler, and is conceptually equivalent to `for (Map.Entry entry : map.entrySet()) { System.out.println(entry.getKey() + " : " + entry.getValue()); }` The second snippet is not equivalent. First, if `map` is a `HashMap`, it would be equivalent to `for (String line : lines) { if (map.containsKey(line)) { Integer counter = map.get(line); System.out.println(line + " : " + counter); counter++; } }` But, since `map` is a `HashMap`, it's equivalent to `for (String line : lines) { Integer counter = map.get(line); if (counter != null) { System.out.println(line + " : " + counter); counter++; } }`
