EArt Video Cutter is a program that you can use to trim and convert videos to the AVI, MPEG, WMV and RM format. It can be easily used by individuals of any experience level. The interface of the application is plain and simple to work with. Video clips can be imported into the list by using the file browser only, since the "drag and drop" method is not supported. Batch processing is not possible. So, you can preview clips in a built-in media player and cut them by marking the start and end position, as well as specify the output destination and format, in order to initiate the encoding process. Furthermore, you can modify audio and video preferences when it comes to the codec, frame rate, sample frequency rate, bit rate, size, and others. On top of that, you can apply image filters (e.g. text, image, temperature, grayscale, rotate, resample). The simple-to-use video processing tool takes up a moderate-to-high amount of system resources, has a good response time, quickly finishes a task and manages to keep a good image and sound quality after conversion. No errors have popped up during our testing and EArt Video Cutter did not freeze or crash. There's also a well-written help file with snapshots that you can look into. Too bad you cannot configure program settings (e.g. enable EArt Video Cutter to minimize to the system tray). Plus, the fact that batch processing is not supported is a major downside. Otherwise, we recommend EArt Video Cutter to all users, regardless of their experience level. EArt Video Cutter Screenshots: EArt Video Cutter Full Version features: Convert AVI to WMV.
