Trigonometric Calculator is a tool designed to make calculating trigonometric functions easy, fast and fun. The application can be used to quickly calculate, type directly in degrees, radians or grads or from a calculator. The present invention relates to computerized systems, and more particularly, to a system and method for determining a route to a remote computer from a device driver for a peripheral component. Computerized devices have become ubiquitous. Computing technology has become so prevalent that devices have been incorporated into almost every area of life. For example, stationary and portable computers have become part of the workplace, home, recreational and leisure environments. Networked computing, local area networks and the Internet have also provided a basis for incorporation of computing into the workplace, home, and even into the recreational and leisure environments. For example, computers have been incorporated into video games, such as first-person shooters. Also, the progression of the computing industry and the Internet has led to increased capabilities and increased functionality by peripheral components. Peripheral components include devices that interface with computer components such as video game systems, computer peripherals, and other types of computing devices. A peripheral component or peripheral may refer to a device that interfaces with a processor, main memory, or other network devices or locations. For example, a video game peripheral includes a cable connector and a control box that may be connected to a video game console. The control box controls the video game console, and may include buttons, joysticks, a display, etc. The peripheral may also be used to interface with another type of computing device, including a portable or stationary computer. The control box receives input from the other computing device and relays that information to the video game console. As another example, a notebook computer may include an optical media drive, which reads and writes data to an optical disc. When computing devices are connected to one another through a network, such as the Internet, a database of device definitions and device drivers is often used by an operating system to facilitate communication and establish a connection to a peripheral device. Typically, a device definition contains the information needed to establish a connection between a peripheral device and the operating system. A device driver is a software program that configures the peripheral for communications with the operating system. When a device is connected to the Internet or another network, the device driver communicates with the Internet Protocol (IP) driver in the operating system to receive and send data. For example, when a keyboard is connected to the Internet, a keyboard driver is activated and the
