Photoshop CS3 advertises an improved autocomplete feature for jumping directly to the next cell when working in a table. If you are using the old-style data entry mode, it does this for you. (See Book IV, Chapter 2 for more information.) Unless you're working in graphic design, photography, or illustration, Photoshop is probably not your first photo editing tool, and you probably get many images in print, on the Web, or elsewhere that are just fine to reuse for other projects. But why

not go further and see what else you can do with Photoshop? This chapter is your guide to getting the most from Photoshop. Making things look better Whether you're converting a piece of scan paper into a finished product or retouching an existing image from a negative into a finished print, Photoshop is an effective tool for making your image look more professional. The number one reason for using Photoshop? It's because it makes images look better. It enables you to transform an image to create a more professional-looking result. At the same time, you can

You don't have to be a trained artist, but you do need to understand the principles of good photography, or you'll have a hard time in producing a stunning image. If you don't have the time to become an expert in the art of photography, then invest in the right software tools, such as Photoshop. They make it quick and easy to improve an image for people who

need it. Updating an image's aging technology Digital cameras and scanners have become commonplace. Although they all use digital technology, cameras, scanners, and other devices are slow to catch up with technology and still use film for producing images. Processing techniques, which use the same photograph multiple times and darkroom adjustments that alter the image, have been available for decades, but the technology behind them is slow. The new Photoshop technology lets you apply such adjustments more quickly and more

Q: Copy datagridview content from one form to another form and format the values my application has 2 forms. 1 that has a datagridview (DataGridView1). Form2 has an empty datagridview (DataGridView2). Now the problem

is. How do I copy the content of DataGridView1 to DataGridView2 as long as all the rows are still in form 1. I do not want to move the data to a file or object as I want to be able to edit the contents of my datagridview1 whenever I want so I am not planning to move the data to a database. I have tried the following but it does not work. try { DataTable dt = new DataTable(); dt.Columns.Add("ID", typeof(int)); dt.Columns.Add("Task", typeof(string)); dt.Columns.Add("Completed", typeof(bool)); DataRow dr1 =

dt.NewRow(); dr1["ID"] = myObject.ID; dr1["Task"] = myObject.Task; dr1["Completed"] = myObject.Completed; DataGridView1.DataSource = dt; //I get an exception that ID is already in use } catch(Exception ex) { MessageBox.Show(ex.ToString()); }

A: I don't think this is an issue of saving to disk but instead copying the data to a new DataTable. You need to create the DataTable that you are going to copy the data to and assign this
