So I don't touch ATI stuff. And I don't touch things that go against the Ubuntu way. Ubuntu is NOT windows. It runs the way it's supposed to. The Ubuntu community is just too big to allow Windows in. Many will buy it on their own if they can, but you will have to figure out how to work with the Ubuntu way. If you get Windows installed, don't be surprised when people who have heard of Ubuntu before just start using it for everything. When I tried to install the windows drivers for my ATI card on a Ubuntu machine, the ATI drivers were selected as the default. If I choose the VESA driver it works perfectly. Just to get Ubuntu to do what I want is very difficult and time consuming. If a person doesn't have the time to do that, then it's probably just not for them. Do you have a quote from a developer or Ubuntu people saying that this is the way the driver works? Quote: Ubuntu is NOT windows. It runs the way it's supposed to. What's New In?

Subtitles is an intuitive and lightweight utility developed in order to provide you with a quick means of finding subtitles for your favorite movies, on the Internet. The program is very user-friendly, doing all the heavy lifting itself and saving you the trouble of manually looking for subtitles. All you have to do is drag and drop the movie that you want to watch in Subtitles' main window and it will automatically search and retrieve the corresponding SRT file. Subtitles downloads the found file in the same location as your video, so you do not have to waste another minute moving items on your computer, enabling you to watch your movie as soon as possible. The program supports various types of input files, for instance AVI, MKV, MP4 or other formats, and still obtain the subtitles you need. The application is supposed to integrate into your context menu, but it only managed to do that on Window 7, failing to do so in Windows 8, meaning it is probably still working out some compatibility issues. Similarly, despite supposedly being able to return results regardless of the name of the video, throughout the performed tests, it only found subtitles for movies with full and correct names. Moreover, this simple utility allows you to choose whether to replace subtitles with the same name during the download process. Additionally, you can search subtitles in variety of languages, enabling you to find the file you need in English, German and French, or many others. While Subtitles does show promise, it could use some improvement in terms of compatibility with all version of operating systems as well as concerning the name matching for the input video files. In conclusion, Subtitles is a useful software solution that can prove quite handy in searching and downloading the subtitles you need for your videos, allowing you to watch your movie in just a few moments.

So I created a block: `__block MyManagedObject * blockManagedObject; -(void)getDataWithBlock:(void(^)(NSArray *))block { [self performFetchWithBlock:^(NSArray *objects) { blockManagedObject = objects.firstObject; // the object has 5 items // but I see 6 NSLog(@"%lu", [blockManagedObject.myArray count]); if (block) { block(blockManagedObject.myArray);`
