The application is ideal for beginners and advanced users. What to expect: Free; Compatible with Windows 7; Simple interface; See protocol and port of the connection; Display information about the running process. Active Ports is a free utility for Windows, developed by SharpTools, with a very simple interface. This means it's not only very easy to use, but also quite straightforward. From the moment you launch the app, there won't be any user-supplied information or prompts, which leaves a clean look, without all the typical information dialogs you get with other alternatives out there. The program runs fast, also because it needs no resources to offer you its services, so it doesn't take up a considerable amount of memory. Where Active Ports really shines is when it comes to displaying information. It provides a list of all existing connections, in total. This includes the protocol, port and address of the connection. An active process could be either TCP or UDP, as well as their local and remote IP and port. This means you can easily identify the machine the connection has been established on. Furthermore, you'll also get a dedicated feature that allows you to terminate a process from the main window. This operation will kill the process, directly from the program, which makes things extremely easy. In addition to all these features, Active Ports also sport a small interface, which includes buttons to expand and close. However, the buttons are placed only in the margins, so everything's simple to access. Active Ports interface Navigation: After launching the program, you'll find a simple main window, which consists of a main panel, three tools and a menu. The main panel is where all the information is displayed. The panel consists of a list with all active connections. On the left side of the window, you'll see the information regarding a process that's currently running on your system. This includes the process ID, process name, its path, current status and termination options. As for the right side of the main window, it's where you'll find all the options for the same process. This includes functions such as Start, Stop, Terminate, Kill and Pass PID to Containing Process. Another advantage
