Scopri Informatics Conexi Biblioteche - Biblioteche Scopri Informatics THE EXTREME POWER OF YAZ BASHARIAN By Jeffrey Lin We live in a time when no one can afford to do without their mobile phones. In the early years of yore, many people had the "forgotten their phone at home" problem, which is, essentially, a problem of just having a phone, and no power to use it. Today it is a problem of missing an unlimited mobility that is often used as a means of addressing one's needs. Even more, if you do not consider the perpetual risks that come along with relying on mobile phone technology, we can easily forget the fact that our brain has been evolving for much longer than the development of today's technology. Aware that a combination of features that most novices take for granted in mobile phones was still a distant reality in his time, Yazdani managed to develop a device that brought his idea of an "on-line" milk extraction system and set modern-day standards. For instance, he was able to create a device that automatically connected to a "milk extractor" computer through the built-in modem, which allowed it to constantly monitor the time and quality of milk being extracted and to send in a signal, if necessary, to automate the collection and filtration process. For those of you who have attempted to extract milk from cows on your own without reaching very high productivity, the Yazdani technology can be considered a revolution. His device would have been like that of your iPhone. This means that it could have been used in the treatment of cancer; you would easily be able to use it to diagnose the proliferation of cancer cells, the development of metastasis and many other aspects of the nature of the malignant growth. Today, Yazdani's invention stands as a testament to the potential of
