AltDragging Description: A: AltDragging is a replacement for the Alt key and the AltDrag utility. AltDrag is an application that allows you to move/resize/show your open windows with the Alt key and your mouse. It is inspired by the old Microsoft Windows XP utility named AltDrag and called AltDrag in older versions.

AltDrag lets you move your windows using your mouse and the Alt key, just like a shortcut to the Window Snapping feature of Windows 7 and newer. In addition to moving windows, you can also resize them and add a custom delay before launching the dragged application. AltDragging is a replacement for the Alt key and the AltDrag utility. AltDragging is a lightweight utility for all of your window management needs. In addition to a few other useful features, AltDragging lets you control and move windows using the Alt key and your mouse (works only in Windows 7 and newer). The interface looks and feels like the old Microsoft Windows XP utility called AltDrag and called AltDrag in older versions. And, of course, AltDragging is a standalone application, so you don't need to download and install the default window manager. So, if you wanted to see how it works, the How it Works page provides a video. While the new AltDragging is able to do nearly all the same things, it's missing a few key things from AltDrag. AltDragging was forced to change the order of windows for some reason. Instead of just sorting in order of most recently opened, AltDragging would sort by 'Most recently associated with documents'. This meant that sometimes the results didn't always make sense. AltDragging had a really, really hard time moving or resizing a windows when the window was in fullscreen. Q: Github Pages stuck with "Branch or branch does not exist in the current state" GitHub Pages stopped working after an update (not sure if it's just a glitch and will be fixed, but I think not). I switched from a /docs branch to master and now my repository can't find a matching branch and I'm getting the error: Push rejected, no matching branch To ! [remote rejected] master -> master (branch does not exist)

I've tried: What does the Branch or branch does not exist in the current state error mean? Upgraded Github Pages to ensure all the build plugins are all updated git branch -D origin/docs Checked that I have a matching branch in another project git branch -r

The weird thing is the website is working fine on my local machine and on some other computers in the same LAN, but it seems to be broken on my server. Any ideas? A: It's solved, all that was needed was to delete the .git/refs/heads/test folder.
