* **Photos** : This is the most basic layer that you can create in Photoshop and is the first layer you create. * **Layers** : Layers are the central organizing principle of Photoshop's use. You can organize your image in layers by grouping your layers, making them visible or hidden, and creating them in layers and making them invisible. You can create a new layer from an existing layer to create a new object and then remove the original layer. You can add a layer mask to a layer to overlay a layer mask on a layer and hide or show the parts you want to. * **Grayscale** : You can create an image that displays only the shadows, midtones, or highlights in the image. * **Channels** : This is a feature that lets you separate and manipulate an image's color channels. * **Merged and Binned** : This gives you a selection of which portions of your image are selected or visible in the image. * **Paths** : Also referred to as clipping paths, paths are drawings that you can use as frames for items in your image. You can create paths with the Photoshop's Pen tool. * **Layer styles** : This adds styles to a layer, such as patterns, strokes, text, and text effects. You can set the stroke width and color of a text effect. * **Filters** : You can use filters to add special effects such as a grunge filter or a color overlay filter. * **Embedded** : With this feature you can add different types of effects to an image that the original photo never had. * **Smart Objects** : Smart objects are image, layer, and mask elements that use the same program format of Photoshop. * **Masks** : You can create a layer mask to apply the properties of one layer to a layer mask. Layer masks control which areas of the selected layer are visible or hidden. * **Creating swatches** : You can create a swatch by coloring an object and select it for adding a swatch. This is a great way to include color swatches in your project. * **Clone stamp** : This feature allows you to create a copy of a source image to use as a template for a new image. * **Color Range** : You can adjust the range of color

An easy way to remove unwanted edges and objects in an image. The Gradient tool allows you to draw on top of an image, to paint interesting and intricate designs. You can create a seamless gradient which goes across the entire image, or you can draw with multiple gradient stops, which make the gradient look more like a smudge and reduce its clean look. You can also use the Gradient tool to create many complex shapes, like the star in the image. The airbrush tool allows you to paint on top of images. You can choose the brush size, and then paint different types of lines. The Magic Wand can be used to select a portion of the image, then the Clipboard can be used to copy the selection over to other areas of the image. This is most useful for retouching images. For example, you could copy all the unimportant features of the image and then paste them into the background. Or, you could copy the background and paste it into a new image. The Pen Tool is useful for adding small details, like in the star. Once you've selected the area to draw, you can then add various pen types to the image. You can also add a dashing effect to the line. The Liquify tool is one of the most powerful tools in Photoshop, and it allows you to sculpt and blur textures. You can easily make an image less sharp by using different settings, such as a Gaussian Blur, soften edges, and add patterns or create a tiling pattern. Depending on the template you're using for your blog, you may already have a place to keep your website files. Many themes offer one folder in your site's "Data" folder for your media. You can also upload the files to a different server on your own domain. After you've installed WordPress and your WordPress theme, let's upload your web content. The first step is to get your files to the server. If you followed my guide to installing WordPress, you already have your files in the Media directory. If you used the W3 Total Cache plugin, you can edit the option "W3 Total Cache Settings" under "Settings > Performance" to the folder in your site's "Data" folder. That will upload your pictures and media files to the server, so you can edit them, add text, and save them

T cells are unique in that they express multiple unique T cell receptors (TCRs), which recognize antigenic peptides in the context of a major histocompatibility complex (MHC). This combinatorial antigen recognition by the TCR/MHC system enables T cells to recognize a wide range of antigenic peptides. The TCR is a heterodimer composed of variable (TCR-V) and constant (TCR-C) chains. Although the V genes encode the TCR-V, the TCR-C chains form the interface with the peptide and MHC. This makes it possible that T cells with different TCRs have similar specificity but different functional consequences. For this reason, there are at least 10-20 TCRs, and more likely 100-2000, expressed by a typical T cell. It is now well accepted that the TCR plays a key role in the development, function and selection of the T cell repertoire. The TCR mediates antigen recognition and T cell activation, and the TCR-C β chain is a defining marker of T cell lineage and is essential for thymocyte development and selection. It is known that TCR-C β influences the specificity and function of T cells. There is evidence that TCR-C β influences thymocyte selection and that it makes a role in the selection of cells that have TCRs with unusual specificity. The TCR-C β chain has been used to help identify cells that express unusual TCRs in an individual. For example, three rare types of CD4 positive T cells have been identified in peripheral blood and shown to be CD28 positive. These T cells include type II T cell, type III T cell and Type I T cell. Type II T cells are CD28+ and comprise approximately 1% of the total CD4+ T cell population. Type II T cells have a V4-39J9 immunoreceptor type and are CD4-/CD8-/TcR ζ +. Type III T cells are CD28-/CD8-/TcR ζ -. Type I T cells are CD8-/CD28-/CD4-/TcR ζ + and only found in the fetus. These rare T cell subtypes are most likely CD4+ T cells that have encountered a pathogen that is not recognized by the conventional TCR repertoire or that have encountered an immunodominant peptide. Such rare T cell subtypes
