been observed in the solar transition region [@1998ApJ...498..553M; @2014ApJ...783..130C; @2017ApJ...841...32C], where these effects should be negligible. One possible explanation for this behaviour is that the amplitudes of the velocity structures observed by this method are underestimated due to the effects of projection in the Doppler shift. Another possible explanation is that these structures are, in fact, physical and not an artifact of the observed signals.

=============
In this study, we have carried out an investigation into the impact of the beam centring effects on

the velocity-Doppler velocimeter measurements of inclined magnetic field by the EFI method [@2016ApJ...830...94D]. We have demonstrated that it is possible to use Stokes I signals to quantify the 3e33713323
