The goal is to track GPS coordinates, save them to a text file on a Unix-like operating system, so you can look back and retrieve it later. The file is automatically named by the time the file was created, and contains the date and GPS coordinates. Use the file name to reconnect the coordinates to the time they were stored.

Windows.Forms.Timer.AutoResetEvent is a high-level class that you use to manually monitor a System.Timers.Timer. The class has a static AutoResetEvent property that you can use to manage the state of the event. This is useful for a variety of purposes, for example, to manage the cancellation of a timer. AutoResetEvent is initialized to false.

Windows.Forms.Timer lets you control a System.Timers.Timer at a higher level than the base Timer class allows. Windows.Forms.Timer allows you to set the Interval property of a Timer, and can also monitor a Timer. Although base Timer is more than enough for most applications, it does not allow you to specify the Time-out value. This control monitors a System.Timers.Timer, and changes the interval of the Timer automatically when the Time-out value is reached. Create a System.Windows.Forms.Timer; if the control is already present, the timer will stop running. If you want to start a single timer, which will run until the user clicks a button, use the StartTimer method. The timer can be stopped by using the StopTimer method. You can get notified when the timer expires by setting the timer's event to an instance of the AutoResetEvent class. ValidateData is used in the Midas example to validate a PDF document. ValidateData checks all of the document's PDF objects and ensures that the content is as expected. It is designed to be used as part of a unit test or as an example of a method being used in production code. XCX is a small Xcode clone written in .NET. Dial Description is designed to help you find the help you need as quickly as possible. It operates pretty much like any modern web browser: you use its search box to input text and press the Enter key to trigger its search mode. The text you input will be sent to the website from where the information is actually retrieved. Software categories Dial Description tries to categorize the information it scours, by providing links to relevant topics that are then read to you. For instance, if you type in "gps" you will get sent to a support site about the Global Positioning System, with links to the latest possible updates about this technology. When you search for "email" or "email clients", you will get sent to this website with useful links about the most used clients. It also introduces you to useful websites and mailing lists, which is a nice touch to help you find the information you are after. However, it is worth noting that even though these categories seem helpful, they also tend to be a bit misleading as well. The website they send you to will be an aggregator of a bunch of different sites, so it is bound to be somewhat useless in terms of clarity and accuracy. If you want to find information about the GPS system, you will have to go through all the sections of this website, since there isn't any way to filter the content. Operating system Dial Description runs on every system that can run web browsers, thus it doesn't require you to install any program. What's more, it is able to extract useful information from websites with just a few clicks. Download criteria Dial Description is available for Windows platforms: XP, Vista, Windows 7.
