movie download free 720p .Q: How do I test  
whether a String is a substring of another String?  
I have this simple question to ask, what is the best  
way to do this. I have read this How to determine  
whether a string is a substring of another string?

---

but it seems really confusing. Also, I am using Java Thank you! A: You can use String search = "abc"; String str = "cde"; if (str.startsWith(search)) { // do something } or if (str.indexOf(search) == 0) { // do something } A: You can do this: String str1 = "Hello World"; String str2 = "Hello"; if (str2.equals(str1.substring(0, str1.length() - str2.length()))) { // doSomething } A: String.startsWith(String str) Returns true if the character at the specified index of this string is the first character of str; otherwise, returns false. String str = "Hello"; if (str.startsWith("Hello")) { System.out.println("it is"); } Due to the nature of the system I'm building, I am forced to require a positive kohm resistor to act as a load. When these chips are used in a practical implementation (this is a work in progress), I will have hundreds of 10k resistors and it will be impractical to use the "Arduino 10k series". I am currently using a 1k, 1/4W resistor (I believe this is a polyester

---

resistor) because it can easily be soldered and placed on a board. Since the 10k is a poor substitute for this resistor, I've been looking for a 1k, 1/4 4bc0debe42
