This study aimed to explore the association between the extent of functional middle lobes (FMLs) and the presence or absence of extra-articular pathologic aggregation in the right and left knees of Knee Arthroscopy score (KA-S) patients. Data were obtained from 500 patients who underwent a preoperative magnetic resonance imaging (MRI) analysis, and a total of 785 knees were found to have extra-articular pathologic aggregation. The angle of the functional medial-lateral line between the extensor popliteal artery and the first branch of the medial-lateral genicular artery (FMO1) and the angle of the functional medial-lateral line between the main genicular artery and the common femoral artery (FMO2) were measured and classified into 3 groups. These 3 groups were determined by the angle of FMO1 (FMO1-3°, 45°) and the angle of FMO2 (FMO2-3°, 45°). The presence of pathologic extra-articular aggregation was significantly higher in patients with angles greater than 30° for FMO1-3° (f30f4ceada
