* **Layer groups** are great for organizing, stacking, and altering all the layers in a document. A _layer group_ is a collection of individual layers that includes everything the layers contain, even if the layers are in different groups. For example, an image with a shape on one layer, the background on another layer, and a shadow below the shape could be organized into three separate layers. A new layer could be added under the shadow layer, and then the black shape could be moved down to the new layer. * **Layer masks** are great for hiding, revealing, or altering parts of individual layers, without altering the images as a whole. * **Selections** are an important way to isolate a specific object within an image. You can use selections to isolate a subject for either further work or to isolate an object to be pasted from another image or copied. * **Blending modes** apply special _color_ (lightness/darkness) filters to a selected layer to mask out areas of the image, or to add light or dark areas or colors to an existing background. There are many blending modes for subtle or dramatic effects. The following sections take a closer look at some of the other ways you can alter images using Photoshop.

Q: Do `import` statements have a preferred order? If I have the following three JavaScript files: foo.js: import bar from './bar'; export default { foo: 'bar' }; bar.js: import foo from './foo'; export default { foo: 'foo' }; and I run foo and bar, how does import work? Does it put the import statement in foo.js first and then search for the file, or does it first try to find the file before trying the import statements? A: Both import { foo } from './foo'; and import { bar } from './bar'; are same. ES6 import is a statement which sets a reference to the specified module.
