Data Augmentation is a free data augmentation extension for Visual Studio 2015, Visual Studio 2017, and Visual Studio 2019 with Blend for Visual Studio. Data Augmentation is a new way to handle data cleaning that tries to match real data with fake data during the development process. In other words, the Fake Data is used to test if a new feature is working as expected, as well as to explore the new feature and see how it works. Data Augmentation mimics how developers develop software in real life, by using fake data. In real world developers can move from an empty CSV file to an XAP file in the matter of a few minutes. Because Data Augmentation is a data generator, the developer is able to take the developer's "working from CSV file" data and make it fit to real world data. The developer also has the opportunity to add data in real world form that helps explore the new feature. This is done by calling the data augmentation API with the required data. **Screenshot is taken directly from VS Community Edition.** This extension allows you to create "Custom Action" for an existing project. The Custom Action can be triggered from the "Add" menu and is executed when a "Add New Item" is created. Other extensions that are similar to Custom Action are: New Project -> Custom Action. New Project -> Custom Menu. New Project -> Quick Action. Project Dialog -> Adding New Items. Project Dialog

What's New In Open Subfolder?

• Open the "Open Subfolder" menu item and then select which folder to open (the currently selected folder, the selected subfolder, or a newly selected subfolder). • If the "Copy to clipboard" checkbox is checked, the path to the folder and any subfolders will be copied to the system clipboard, so you can paste it elsewhere. • The "Open in new window" checkbox allows the folder to be opened in a separate window. If the "Refresh" checkbox is checked, the location will be re-checked for any subfolders or subfolders with subfolders. • The "Open in Explorer window" checkbox will open the folder with a blank prompt, allowing the folder to be opened in the Windows Explorer window. • The "Open in new tab" checkbox will open the folder in a new tab in the current window. • The "Show selection only" checkbox will only show the path to the selected folder. • The "Copy to clipboard" checkbox will not be ticked if the currently selected folder has no subfolders. The 3 other options are unchanged from Quick Launch's context menu. Features: • Works with any Windows dialog box, including the New Folder, New Document, Save As, Cut, Paste, Select All, and Send To. • To select a subfolder, select it in one step with the arrow button. To select a subfolder with subfolders, select the parent folder first. • On some folders (such as the My Network Places folder, Open Document Folder, and Computer), Open Subfolder will not appear in the contextual menu (this is because those are special folders that handle their own context). On those special folders, you can still use Open Subfolder and it will work normally. • If you use an alternate path to your current folder, Open Subfolder will not be

able to find your current folder. • Open Subfolder will not work on the Notes or Contacts dialog boxes. • You can not change the context menu's submenu items. • Open Subfolder will not work with a folder located in the Windows "Startup" folder. • On some folders, Open Subfolder may not be able to open the folder due to being unable to determine the type of the selected folder. For example, a file on the desktop has a text file extension, while a file in the All Files folder has a JPEG file extension.
