Chipset.Responding to growing concerns about the impact of the abuse of drugs on ourselves, our families and society as a whole, there is every reason to be optimistic as the EU's Strategy on Drugs 2014-2018 is published. This strategy is based on the reforms of the political priority "action for a drug-free Europe". In the context of the EU Strategy, the European Commission will provide, for the next five years, €19.2 billion for fighting the high cost of drugs in the EU. The EU Strategy is built on solid evidence-based information to address the underlying drivers of drug abuse. It will result in a major reduction in the production and trafficking of drugs, an increased number of drug-related deaths and an increased cost of drugs for consumers. It will also seek to prevent drug misuse through an effective drug prevention and treatment system. The strategy will not only protect the lives of Europeans and prevent the associated social and economic costs; it will also assist countries in fulfilling their obligations under the 2012 UNGASS Resolution on the World Drug Problem. By delivering on its commitments to make a positive impact on the lives of the people who use or are affected by drugs, the EU Strategy provides a model that countries can follow. Drug prevention, treatment and demand reduction policies must be closely integrated, involving communities, schools, families, the police, health and justice sectors. The EU Strategy contains three interdependent cornerstones: Denial and prevention In the light of the high cost of drugs and the benefits of drug demand reduction for all, there is every reason to focus on prevention. Drugs can become a permanent fixture in the lives of individuals and families. Prevention measures include prevention of drug use in children, adolescents and young people. Treatment and rehabilitation It is in all our interests that those who suffer from drug-related problems should receive the help and treatment they need, both for their sake and to protect the health and safety of others. are the possible mistakes of creating views in Android? All examples about views in Android show the usage of canvas. Why is it necessary to draw the views in a canvas if you can just create a view directly? In other words, what are the possible mistakes of creating views directly? A: What you are asking is what is the purpose of a View? A view is an object that allows you to define the visual appearance of your interface. This could be as simple as a TextView or something more complex like a View with UI Components. For example you have a piece of text and you want it to have certain style (you might want to make it bold, bigger, etc.). You can either use a TextView and apply styles to it or you could define a View that consists of a TextView (or several TextView) and then apply different styles to the specific area of the view to modify it. The difference is that this View can be reused. You can also have more complex views with buttons, edit text, etc. which you can reuse again and again. So a view allows you to reuse something you made once in many places without having to re-invent the wheel. Functional differences of mast cells in preeclampsia.
