To open a Photoshop file, click its icon in the Start menu. In Windows, the Photoshop icon looks like a folder with a black box; in Windows Vista, Windows 7, and Windows 8, the icon looks like a white box on a black background. A beginner can use Photoshop right away, but here are a few tips to help you get the most out of your Photoshop experience.

1. Use basic tools Over the years, Photoshop has added new tools and features. It's a powerful program that, when used, is generally capable of very interesting and creative things. However, those tools require a bit of practice before they feel natural. Therefore, it's a good idea to start with the basic tools. These tools perform very basic things, such as selecting parts of an image or adding text. You can manipulate an image using the tools available in the toolbar. Just click the tool you want to use, and select the item you want to manipulate by clicking the tool and using the arrow keys on your keyboard to move the image. For example, if you press the Rectangular Marquee tool, you can resize the image or paint over an area. In the earlier "Selecting part of an image" section, you select an area of an image and then copy that area by using the Edit ► Copy command. You can move and resize a selected area of an image with the Rectangular Marquee tool.
2. Draw a lot Photoshop isn't just for drawing—it's a vector-based program, meaning that what you draw and what you see on the screen are different. Just to make sure you know that, let's look at a photo of a map drawn with a pen. Notice that the lines are thick, but the photo shows a skinny line. It's important to understand the difference between a real image and a vectorized image. To vectorize a photo, you start with a basic photo in the size and resolution you want, and then use the Pen tool to create lines. When you have the path you want, you adjust the line width and color using the Line (L) tool. The width determines how hard it is to see the line, and the color determines the line's color. You also can click the Pen tool options icon in the Options bar to open the Line Options dialog box to view various line-drawing options.

1. Field of the Invention The present invention relates to a slip prevention mechanism for a vehicular steering wheel which prevents such improper acts as steering wheel slip from being done with the steering wheel, and can stop the vehicle by acting as a safety mechanism. 2. Description of the Prior Art In the prior art vehicular steering wheel 101

is attached to a steering shaft 107, as shown in FIG. 7, by inserting a boss 108 in a boss hole 102a of a rim 102 in contact with a cylindrical portion 107a provided on the side of the steering shaft 107, then tightening a cap 101 with the boss 108 within a boss hole 102b of the rim 102 by a tightening member 109. The steering shaft 107 is prevented from rotating by a locking means not shown and a predetermined clearance is kept therebetween. The inventors of the present invention have, however, observed that the conventional arrangement described above has the following problem: The boss 108 in contact with the cylindrical portion 107a of the steering shaft 107 is apt to be broken by bending under the weight of the vehicle or the force of pressing in the steering wheel during the vehicular operation, and the steering shaft 107 is prevented from being held to the boss hole 102a of the rim 102. In the prior art steering wheel, on the other hand, the boss 108 in contact with the cylindrical portion 107a of the steering shaft 107 is provided at the rear of the boss hole 102a, and a through hole 109a into which the tightening member 109 is inserted is provided at the front thereof. The steering shaft 107 is prevented from being mounted to the boss hole 102b of the rim 102 while the tightening member 109 is pressed against the steering shaft 107 from above the boss hole 102b of the rim 102 in a vertical direction, and the boss 108 is attached to the boss hole 102b of the rim 102. As a result, the steering shaft 107 is prevented from being mounted to the boss hole 102b of the rim 102. In other words, the boss 108 is prevented from being broken by bending under the weight of the vehicle or the force of pressing in the steering wheel during the vehicular operation. Further, the tightening member 109 is pressed against the steering shaft 107 by the urging force of the urging member 110 during the vehicle operation, and the steering shaft 107 is prevented from being removed from the boss hole 102b of the rim 102. The tightening member 109 is preferably made of metallic material having elasticity, and made so
