1. _**Open a photo file to work on.**_ Open the image you want to edit. Make sure it is in a format that Photoshop can handle. If you're using a RAW file, you may have to convert it to either JPEG or TIFF format. Choose File | Open and then click on the file. The Open dialog box opens. Select the format of the file you're opening, as shown in Figure 14-1. You can choose from several file formats, including: * _JPEG:_ This is the standard file format for the Web. Choose JPEG if the file is a high-quality JPEG file. * _TIFF:_ This is the standard format for film scanning (although many different kinds of film are still used). Choose TIFF if the image has a high resolution of 72 dots per inch (dpi). 2. _**Add a layer.**_ Photoshop calls the files used to represent layers _layers._ These are distinct from _effects_, which are found in the Adjustments panel. In the Layers panel, you see an icon representing a new layer. Click that icon to open a new layer. The layer icon looks like the one in Figure 14-2. A new layer icon is always visible on a new layer. When a layer contains more than one layer, you can see the number of layers underneath the icon, as shown in the figure. Figure 14-1: Choose a file format to open in Photoshop. Figure 14-2: The Layers panel icon is the same size as any other icon in the program. 3. _**Choose your color mode.**_ You can use the Type tool to select a color mode — CMYK (color) or RGB (red, green, blue). This is the same process you use to choose the color in the photo. 4. _**Choose your format.**_ Your options include RGB, CMYK, Grayscale, and Indexed Color (duh). Again, you use this process when selecting the color in the photo. 5. _**Choose your type style.**_ Select one of the Photoshop type styles, such as Text, Display, and Web. The incidence of hypertension in Hungary is high, and has declined in the last decades. It is currently the most important cardiovascular risk factor. In addition to its direct cardiovascular manifestations, hypertension contributes to other cardiovascular complications: ischaemic heart disease, stroke, heart failure and renal artery stenosis. Aim Early detection of risk factors and timely preventive treatment are a crucial priority in order to prevent the onset and progression of cardiovascular disease. The present review aimed at establishing the current state of knowledge of the subject and current strategies in the prevention and detection of hypertension in Hungary. Methods An extensive search of the current literature was conducted by electronic and hand searches. Articles published in Hungarian in this area were included as well as international ones, mainly those focusing on Hungarian patients. Results The serum creatinine level is one of the most important predictive parameters of the development of chronic kidney disease (CKD). CKD is a potentially reversible and important risk factor for cardiovascular events, which can be controlled. About Kidney Disease There are many types of kidney diseases (here, I want to focus on types that result in kidney damage and kidney disease). About 99% of people with kidney disease are born with their kidneys, so they do not usually recover. About 1 out of 8 children are born with a kidney disease. These can be hereditary or acquired kidney diseases (i.e. diseases of the kidneys). Almost all children with kidney disease get better and don't need treatment when they grow up. If your baby is born with a kidney problem it is called kidney disease. The symptoms of kidney disease can't be seen in babies and the first signs that you are born with kidney disease, you usually learn on your own. About Chronic Kidney Disease Healthy children and adults have a normal amount of protein in their blood. Chronic kidney disease (CKD) is a long-term problem that can lead to kidney failure. Most of the time the cause of CKD is not known. Some types of kidney disease are genetic, and another type is toxic, such as from drugs, to name a few. What is CKD? Several kinds of conditions affect the kidneys, which are the organs that make urine. CKD means Kidney Disease. Kidneys are important to the body's functions such as: blood making and controlling the amount of water and sodium in the body. The kidney filters the blood and helps keep
