Because most tutorials available to Photoshop users have only minor edits, beginners often can learn most of what they need by watching videos on YouTube and doing more minor editing themselves using trial versions of Photoshop. If you plan to use Photoshop for more serious, larger projects, take the time to get up to speed with the basics. You should get to know how to use all of the features of Photoshop before you start any major projects. Beginning with Photoshop Elements Elements is a self-contained, easy-to-learn, and user-friendly version of Photoshop. When you sign up for a subscription to Adobe Creative Cloud, you receive a download of Elements from Adobe. The program is fully supported and designed to do exactly what you want, such as resizing, cropping, and red-eye removal. It is meant for beginners who want to learn and work with raster images and don't want to learn complicated commands and go through numerous steps to perform just one task. The program is easy to navigate, much like Elements 2011, and you don't have to know much about the functions of a computer to use it. After you install the program and log into it, you can drag files from your computer to the program, and apply a variety of filters, effects, and other functions. You can also create your own templates and use the Quick Selection tool to select areas of your photo. Photoshop is a much more powerful image manipulation tool, but Elements simplifies the learning curve for many beginning users. Alternatively, you can buy a copy of Elements directly from the Adobe website. Applying New Fidelity The original version of Photoshop, Photoshop CS, gave people the power to manipulate photographs into something different from the original images. Earlier versions of Photoshop used to have a relatively small file size — upwards of 25,000 pixels across. Today's Photoshop is much more powerful and larger, but it's not as easy to work with as before. You can manipulate the pixels in a photo at an atomic level, even after you've saved the file, using Photoshop's Content-Aware Move feature, and using Content-Aware Fill to fill the missing parts of the photo with matching content. \* \* \* # Mastering the art of image adjustments Your first few attempts at modifying an image can go very wrong, but if you practice and use the tools Photoshop provides for image adjustments, you can make great changes. Getting started is easy. Launch Photoshop Elements and make your first images. When you're ready to start creating your next masterpiece, Photoshop Elements has the features you need. To learn about Photoshop Elements, you can read the About Elements section of the Photoshop Help Center. If you have questions about Photoshop Elements, the best place to get answers is the Adobe Support Center. You can also read the Photoshop Elements Help pages directly. Here are the most common Photoshop Elements features. Photoshop Elements FeaturesQ: Prompt for text selection This code prompts for a text selection and returns the first 10 characters that match. If you happen to know Python, it makes sense to you. You can pass a value to it by passing it a variable like: prompt("Please select a character to find") or prompt("Please select a string to find") My problem is that I want to return the first 10 characters that match. Here is the code: print " Enter a string or character to find: " user\_string = input() if user\_string == 'str': user\_string = string() else: user\_string = str() user\_string = user\_string.upper() user\_string = user\_string.split() u\_string = user\_string(0:10) I then use a list to store the first ten characters of every string. The problem is that I can't use an index or something because I get an error: TypeError: 'UserInput' object is not callable I want to avoid using loops for this because it increases the amount of code. What I really want to do is create a function with this code and then parameterize it like: def promptForUser(char, num): print " Enter a string or character to find: " user\_string = input() if user\_string == 'str': user\_string = string() else: user\_string = str() user\_string = user\_string.upper() user\_string = user\_string.split() 05a79cecff

Religious concerns about science and technology in Sweden. Research has shown that people from the Nordic countries, including Sweden, are generally positive towards genetically modified organisms (GMOs) and more accepting of genetically modified foods than citizens from other countries. Nevertheless, many groups in Sweden seem to have an ambivalent attitude towards the scientific and technological developments in the food area and there is widespread concern about the release of genetically modified foods. In the main, religious people in Sweden appear to be the most critical towards the use of genetic modification for food production. This article investigates the sources of such rejectionism. In particular, it focuses on how scientists, science policy, religious groups and civil society in general perceive and evaluate scientific developments that involve the application of genetic modification for food purposes. These attitudes are investigated by means

. Indeed, at the constant frequency, the anharmonicity is reduced to  $\gamma_{\text{meq}} 0.0225$  Hz. Since this frequency is close to resonance with the second vibrational mode of the nano-diamond, we expect that the effects of the photon drag on the collective inelastic interaction will be strongly affected as reported in Fig.  $\frac{1}{2}$  for the harmonic case. The observed strong effect (experimentally observed as an  $\epsilon=0.45$ ) is due to the frequency at which the photon drag manifests itself. It is possible to see that the increase of the interatomic distance results in a considerable increase of the dipole-dipole interaction, which, in turn, enhances the photon drag in the collective dipole oscillation, as observed in Fig.  $\frac{1}{2}$ . Similar results are expected when the static electric field is applied along the principal axis of the nano-diamond instead of the the axis of rotational symmetry which is the case studied here. Such an electric field has been realized experimentally by placing a gold nanoparticle close to the surface of the diamond [Fleischhauer]. The effects of the electric field can be investigated by varying the strength of this applied field. \n Conclusions ===== We have analyzed the characteristics of the inelastic dipolar interaction between two nano-diamonds suspended in a He bath. Our results show that the interaction coefficient is strongly dependent on the orientation of the nano-diamonds with respect to the applied static electric field. In addition, the photon drag exhibits a strong dependence on the orientation of the nano-diamonds. In particular, the motion of a nano-diamond along the polar axis of the electric field results in a strong enhancement of the dipolar interaction and the photon drag, while the motion of a nano-diamond along the principal axis of the electric field (which is the axis of the rotational symmetry of the system) does not affect the interaction coefficient. These findings call for further analysis, since such an electric field can be used for the realization of a new family of controllable systems for quantum information processing [DNP03; @Wolf; @Rabl]. The realization of a quantum network of such systems can be achieved using the combination of the strong coupling between the two ground states of the nano-diamonds with the properties of photon drag
