A typical three-phase electric motor includes a plurality of opposed rotor-stator poles having a plurality of stator windings, respectively. A single winding is typically provided for each pair of rotor-stator poles to form a single phase of the motor. A three-phase induction motor typically includes three such windings (or pairs of rotor-stator poles). An advantage of three-phase induction motors over two-phase motors (generally referred to as "synchronous motors") is that a three-phase induction motor is capable of running at higher speed than is a two-phase synchronous motor. A three-phase induction motor may typically operate at speeds in the range of about 10,000 to 100,000 revolutions per minute. A three-phase synchronous motor is typically capable of operating at speeds at most in the range of about 3000 to 8000 revolutions per minute. A problem associated with three-phase induction motors, however, is that they are more sensitive to electromagnetic effects. Electromagnetic effects, such as high frequency electromagnetic noise or EMI, may be problematic for a three-phase induction motor operating in a hostile environment because of the high frequency of the EMI. For example, the rotating shaft of a three-phase induction motor may be, and typically is, electrically connected to the rotating shaft of an electric motor drive (e.g., a rotating fan of an air-conditioning system). The rotating fan drive is typically noisy, and rotating fans are typically relatively slow-moving, such as being capable of

I try to use as many apps as possible on all my PCs and I like to keep them all up-to-date. When I updated Windows 10 from a previous version I had to do a clean install, so I downloaded a backup, which I saved to a USB stick and then made a new copy of Windows 10. Then I was happy to find that I had kept all my data. I downloaded every important app I used and I found that it is easier to download and install them to my new computer than to install my old apps again. And I downloaded many of them on to my Kindle Fire and they have all worked perfectly. I do like to download apps and games on my tablet, so I have an old Windows 10 tablet with Office Home and Student 2013. I like to keep it up-to-date. I can use Office for Android as well as some of the other Office apps. And I like using my tablet to access my photos, music and videos. Farming in Pennsylvania Farming in Pennsylvania grew in importance during the 19th century and 20th century after the Pennsylvania General Assembly legalized the production of rye, corn and barley for human consumption. During this time, the largest area of production was the Central Bountiful Valley area, which grew up around Oxford, Pennsylvania, for the production of rye. Before the 19th century, Pennsylvanians primarily ate beets, along with some acorns and nuts. These were an important part of Pennsylvania's diet. Common vegetables were turnips, cabbage, beets, and onions. The state became a producer of vinegar, as the settlers wanted to make alcohol, but found corn fermented to a good length worked better. As the country became industrialized, Pennsylvania became a big producer of wheat, pork, and other grains, and a large number of farms and mills began to appear. These states grew up between Philadelphia and Pittsburgh. The railways which grew up in the early-20th century helped produce a large number of farms. Conestoga wagons were used to carry corn from the farms to the big mills at Wilkes-Barre, Lackawanna and Erie to the north, where it was milled. Land Most of the farms were formerly rich agricultural land, and did not have to be farmed for many years after it was cleared. There were, however, some large farms in Pennsylvania. These farms generally grew wheat, and sold their grain to large mills for flour. Many were very large. One in Tioga County was on, and comprised the town of Bingham. Another in Luzerne County was in the township of West Olive, and was, and had over five hundred buildings on it. Three of the largest historic structures in Pennsylvania are on these large farms. The second method of taking land was for farmers to buy land to build houses on. The men in a family would clear away the woods, and plant wheat or corn. Gradually, their houses grew up around them, and they become part of a village. Each village became a town, and a town like Scranton, became a city, much larger than the towns it was

The aims of this study were to describe the characteristics of the clinical breast cancer trials registered in the Spanish Breast Cancer Network (SCETG) from 2000-2014 and assess the oncologists' perception of membership with this Network. The data was obtained from the SCETG registry and analysed anonymously. During the study period 28,289 clinical trials were registered in the SCETG. Of these, 4,573 were clinical trials with a breast cancer component (16.4%). Of the oncologists surveyed, 93% of professionals belonged to this Network. Oncologists had received 15% of the credits assigned for participation in the SCETG. The Spanish Breast Cancer Network has mainly been used by oncologists, although it is not the most adequate option to capture the daily activities of clinical trials in Spain. A good sense of humor is a central part of life and a very real important part. While some people are funny, others are extremely funny. But seriously, humor is some of the most powerful and life-enhancing tools we have. Humor can be used to change someone's state of mind, or improve a situation, in a minute or two. And it can be applied to just about anything! It's like a smile - if you can laugh at your situation, you can start to take control of it and start to change it. We all need a sense of humor, and for me, it was never more important than it is now. I started late in life to develop my sense of humor, having seen a lot of good and bad humor, and thought I could contribute. So I started to write. I have written humorous memoirs, an humor blog, and now I'm working on a funny novel. This whole
