It contains definitions of windows, menus, event procedures and function pointers. When a program is not executed directly by a human user, it is executed by an automation software. There are two types of automation software: an execution engine and a monitoring system. An execution engine transforms the instructions of a program into a virtual computer. When the program is finished, the execution engine sends the necessary code to the central processing unit (CPU). The monitoring system is also known as an execution report. The program does not interrupt the execution engine, but it tells the software when to stop, so that it can send the results of the analysis to another system. Other common programs are help-textual, configuration files and service-diagnostic files. All these files contain logical instructions that are read only by a particular program. Help-textual files contain instructions on how to use a program: screen-shots, procedural instructions and in-depth information. Configuration files contain information about the hardware and

software of the computer. It may be for example the program version, the operating system, add-ons installed, network interfaces, firewall settings and many more. Other files contain instructions on how to use a program, information on the application's parameters, configuration properties and more. Documentation files are mostly forms created for the user to fill in. They are used to collect data. Examples are time sheets, enrollment forms, billing forms or lab reports. Once everything is done, these files are printed, sent or stored in a folder on the computer. Frequently, the software is a terminal emulator, a window management system, a graphics editor, a text editor or a monitor. The executive summary

part of the kitchen. They not only allow us to keep most of our kitchen tools, equipment and appliances in one spot, but also hide any unsightly messes. Thus, we need to develop a system that will function well and do its job effectively. Designed to be useful and to look good, a kitchen organizer doesn't need to be expensive. We also don't need to go overboard when it comes to having enough storage space. We can easily find nice and functional solutions for our kitchens that won't break the bank, but will do a great job for us. From organizational racks to wood storage boxes, we have all the options we need for a well-organized kitchen. We need to decide what we want, however, as not all options are suitable for all kitchens. What kind of kitchen organizer do I need? An organized kitchen needs to have spaces, of course. This will be the ideal spot to store cookbooks, cooking utensils, cutting boards, and the like. Having a collection of these cooking tools organized in a dishware rack and on a kitchen buffet will help us keep everything easily accessible. In addition to "D" and "L" shaped racks, there are several shelves we need to consider. Shelves allow us to add extra storage for various containers, pots, and pans. Depending on the storage need and size, we can choose between small shelves that easily mount on a shelf bracket or high shelves that we can place on the floor. Each of these shelf options offers a different perspective. We can always find a solution that will work well for us. Another option we have is a slotted kitchen shelf
