The distinction between Photoshop and other graphics editing programs is that Photoshop is primarily used to edit digital photographs. Other programs use a similar layer-based approach and also provide features for working with images, but Photoshop requires knowledge of other programs like Adobe InDesign and Illustrator for the layout and design aspects of a Photoshop file. Photoshop has more than 20 years of market dominance and an unwavering commitment to ongoing innovation. It remains the preeminent program, and many courses offered in the field of graphic design still include Photoshop as their primary image-editing tool. However, the future of graphic design is not exclusive to Photoshop; other programs, such as Microsoft's Expression Web, have moved into the graphic design tool market as designers seek not just editing tools, but also web design tools. Nonetheless, Photoshop remains the industry standard for manipulating and enhancing images, and that's not likely to change any time soon. Finding your way around Photoshop Photoshop has several tools on the left and right side of the screen. These tools can be used either on their own or in combination with other tools to enhance your work. Toolbox: The toolbox on the left side of the screen is where you store all the tools you've used in a file and where you access them with the appropriate keyboard shortcuts. The tools are organized in order of the subject matter that they affect in the image: Brushes: These are usually quick-and-easy tools that quickly change the look of a selected region on a layer. These tools often get rid of unwanted elements in a bitmap image and sometimes clean up messy photos. Patterns: These tools can alter the look of an object without affecting the picture's background. They often alter the color of the object (for example, applying a different pattern or color filter to a photo). The LookUp feature lets you apply a specific pattern to a region. Gradients: These are a little like patterns, except that they automatically repeat where the gradient is applied. Gradients can also be used as color washes, which creates a unique blended look that looks a lot like watercolor painting. Filters: These tools alter the look of an object without altering its photographic appearance. These tools can turn a photo into a transparent image that looks like a negative or add special effects like blurring, in-painting, and blurring. Drawing tools: These tools include drawing tools like lasso and text tools like the text tool. These tools can

Q: Plot direction of gravitational force I know how to plot the position of a particle in the centre of a central force, like this:  $X''[t] == (-m * X[t] * F[t] \text{Cos}[\text{theta}[t]])$   $Y''[t] == (m * Y[t] * F[t] \text{Cos}[\text{theta}[t]])$  But the question is: what is the direction of the gravitational force? A: The gravitational force acts at a constant vector. We have the usual general radial case  $F[t] = -G m \{1, 0, 0\}$  and  $\text{theta}[t] = t$  We get  $X''[t] == (-G m (1 \text{ Cos}[t] + 0 * \text{Sin}[t])/1)$   $Y''[t] == (G m (0 + 0 * \text{Cos}[t])/1)$  The initial conditions  $X[0] == X_0$   $Y[0] == 0$   $\text{theta}[0] == 0$  We get  $X[t] == -G m t \text{ Cos}[t]/1$   $Y[t] == G m t \text{ Cos}[t]/1$   $\text{theta}[t] == t$  We note the force acts always in the same direction, as usual.
