Welcome to the WallParse FreeWare v2.3.3.0 FreeWare Edition. WallParse is a Windows and OSX Windows application and it stands for "Wall Parse", WallParse is an application that is used to audit a firewall configuration and determine whether or not it complies with the requirements of the PCI Data Security Standard (PCI DSS). For a moment, we just wanted to illustrate the basic capabilities of WallParse, a tool that will be used to audit a firewall configuration and find problems such as missing authentication, incorrect protocols, and too many open ports. We can also determine whether the firewall is running in compliance with the PCI DSS requirements. If you are preparing a PCI review, then WallParse is a must-have tool for you. PCI DSS Audit Tool: PCI DSS compliance is a requirement for any organization that does business in any aspect of financial services. In some countries, the organization that has its' headquarters located within a country with PCI compliance (US, EU, Australia, and New Zealand) is required to comply with PCI DSS to secure its' customer data. Even though banks are the main drivers to auditing the compliance of a firewall, web-hosting companies, mobile service providers, WiFi network providers, and VPN providers are also required to comply with PCI DSS. PCI is a set of security standards that regulate the retail banking industry. It is a set of requirements that an organization must meet to secure the data of its' customers and employees, and prevent theft or misuse of the sensitive data. The organization must do so to demonstrate to its' clients, shareholders, customers, creditors, business partners, and vendors that it is a safe and reliable organization that will protect their data. PCI DSS also ensures that all the data is stored and processed securely. The organization must provide proper protection of its' data using encryption, firewalls, and the monitoring of user activity and the flow of data. With the increasing number of malware attacks in recent years, it is necessary that organizations are taking the necessary steps to protect its' data against theft or misuse. The costs of a security breach can be very high and can reach any sum in the ballpark of \$10 million. PCI DSS compliance is a requirement to protect from these types of threats. PCI DSS Compliance PCI DSS has 3 components that must be satisfied in order to be considered PCI compliant. These components are

WallParse is an enterprise wide IPS (intrusion prevention system) audit tool, capable of providing a detailed check of any Windows firewall configuration or settings according to the compliance criteria of an organization. WallParse is able to identify where any aspects of the file are not consistent with the security policy. "Separating normal function from sensitive system components is important in a secure network. Today almost all firewalls today will export the rules for their settings in order to provide a way of overriding normal settings for active rules or to re-enable a feature that has been disabled for performance or to record rules or configuration for an audit. If the system has a default configuration, then the first step is to take a copy of the ACL file and name it using 'Acc-Logon'. An example of this would be 'Acc-Logon.txt'. Once you have captured the details of the firewall settings for your system, you should then proceed to run the security audit; this is done by placing the 'Acc-Logon.txt' file in a directory on the drive. WallParse performs a check of the configuration file against the security audit guide. If there are any changes, then a message will be displayed and you will need to review the changes and make the necessary adjustments. WallParse allows you to enter custom rules to be used in a security audit or to enforce the security policy of the organization. If you are lucky, then WallParse will indicate that all settings in the list are in line with the designated requirements of the organization and no further action is required." WallParse Audit Review Result: There were some changes that needed to be made to the configuration file which are indicated by the red arrow (red X) in the picture below: "WallParse (WallLogon password has been changed to allow greater access to the machine and prevent others from viewing its contents) The use of well-written policy and intention control rules is important for a secure network. There are many examples where this is ignored or not specified. The following section will identify the many areas where well written policy and intention control can be enforced and how to implement this. Intention control can be enforced by the use of (user='user1') where the user is a user which is restricted from having root access. Policy control can be enforced
