Not a lot has been reported on the new microSD card format, called UHS-I, and its successor UHS-II, so we were rather surprised by a recent report claiming that the new format is fully backwards compatible with UHS-I memory cards. That is, the new cards work with cards using the same connector and protocols as their predecessors. That's right -- both new SD

cards and their predecessors have the same UHS-I/UHS-II speeds, with UHS-II cards having even faster data read and write speeds. The new SDXC (X for eXtended) cards will get even faster writes. This is rather different from what we were expecting. UHS-II, on the other hand, is almost exactly what we predicted. We speculated in June about a move to parallel-only transactions, but that's actually the new-and-improved UHS-I.

UHS-II has a faster controller, but that's the only major difference. So, what's going on? Credit to the folks who uncovered this, in particular at the DejaNews forums. They speculated that UHS-I could cause problems in applications that load raw files directly into the SD card, and that might be the reason for the slower speeds. That's a bit more complicated than the port incompatibility of XQD and SD, but there are no

physical differences in the SD card. SD is still a relatively new format, and it has had to handle lots of different cards with different speeds, connectors and host interfaces. However, the spec is relatively stable now and memory card vendors are moving to help standards evolve. We imagine that microSD-to-microSD card and UHS-I-to-UHS-II card compatibility will help speed the development of new applications. We're curious

about other files that might see the same compatibility, as well. Have you noticed it? Let us know. [DejaNews via SD Authority]Nanowire Luminescent White Light Emitting Diodes Based on Tetrapyrrole Derivatives. We report the first example of white light emission from optical nanoparticles. Stable white light emission was achieved using high aspect ratio cores, which are about 10 times longer than

their diameters. The emission characteristics of the core/shell nanoparticles were discussed on the basis of a simple phenomenological model. Moreover, the effect of core diameter
