You can begin working right away to create your first image, or you can continue working with a project as you go along. For your first try, however, you may want to start with an easy project. As a beginner, you don't need the complex features and options that an expert would use to create a professional-quality work of art. Figure 3-1 shows you some of the default options available for working with a new document. The simplest way to start working in Photoshop is to create a new blank document. FIGURE 3-1: Pick a project that helps you get some experience working with Photoshop. ## Creating Your First Photoshop Document You can create a new Photoshop document by starting from scratch or loading a previously created image. To create a new document from scratch, click the New button on the Photoshop window menu bar and then click Blank to create a brand-new document (see Figure 3-2). A new, blank document is created and appears on the left side of the screen. The appearance of a new document may look somewhat different, depending on which display you have selected; if you're using the Display (Windows) or Window (Mac) menu, you can change the display to a new workspace. FIGURE 3-2: Click the New button to create a new document. You can start working immediately by filling the area to the right side of the document window with some of your own artwork. Just click and drag in your chosen area. After you fill in the first image,

Q: Can I style a inside a with CSS? I've never used CSS before and am in search for some help. I'm trying to style a element that contains many 's inside a that has both box-sizing: border-box;, border: none;, and margin: 0; but it's simply cutting off the bottom of the when I try to use custom CSS. Here's a GIF of the problem. I want the red div to be as it's placed, the black and green div to be thinner then the height of the main image. Here's a link to a GitHub repo GitHub Repo CSS code is in the style.css file. A: You have a simple text-overflow: ellipsis; on the child . Simply remove it. Q: Why "tearing" is more frequent with the 60Hz refresh rate? We do not have much memory of the old CRT TV using the 25Hz or 50Hz refresh rate, we just remember the tearing. I was wondering why 60Hz is more prone to tearing? It seems that the refresh rate is considered to be just the frame time. A: it seems that the refresh rate is considered to be just the frame time The assumption behind this is that a monitor is showing you only one frame (or colour value) per (apparent) frame displayed on the screen. The refresh rate is the number of frames displayed per second - it's not necessarily the time elapsed since the last displayed frame. With a 60Hz refresh rate, you are displaying 60 frames per second - it doesn't make any sense to consider each individual frame as a discrete piece of information, only the one displayed at any one time. A 24Hz refresh rate means you show 24 frames (of whatever, eg, 60 frames per second) per second - it's still not the same thing as showing one single frame per (apparent) second. Also, with a higher refresh rate, the transition time for the new frame to actually appear on screen is shorter. So there's no need to wait for the new frame to update before you want to see it. Thus if you want to display a single frame (or colour value) once per second, it's better to use a higher refresh rate. As for why
